# PhytoCide Aspen Bark Extract Powder

## Technical Data Sheet

### BACKGROUND

*Populus tremuloides* also referred to as Quaking, Trembling or American Aspen originates in the northern and western areas of North America. The trees typically grow in vast colonies that originate from a single seedling. The trees' primary means of reproduction is via the sprouting root suckers (new stems) from the roots. Although the trees live on average between 40 and 150 years, the root system can survive for a considerably longer period of time. In fact, an Aspen colony in Utah referred to as 'Pando' is said to be 80,000 years old, which would make this colony the oldest living colony. The Aspen's root system is capable of spreading approximately one meter per year and is therefore capable of expanding to cover an area of several hectares. One reason for the tree's success is due to the ability of the colony to withstand fires. Although the trees may burn, the roots that are capable of sprouting new trees are safely below the fire's reach.

### SCIENCE

The bark of the Aspen tree is rich in salicylates that may function as the plant's natural defense mechanism against invading parasites. The salicylates in Aspen bark may also be used for medicinal purposes. Medicinal barks have been used as analgesics and to reduce fevers for centuries. Today, doses

of 1 to 3 g of bark with concentrations ranging between 60 to 240 mg of salicylates is recommended as an analgesic for low back pain.

### BENEFITS

These salicylates may be isolated from Aspen Bark and applied to cosmetic and personal care products as a natural alternative to traditional chemical preservative systems. Our manufacturing method allows us to consistently isolate a salicylate content between 54.0 – 60.0%, which makes **PhytoCide Aspen Bark Extract Powder** an ideal antimicrobial. As an additional benefit **PhytoCide Aspen Bark Extract Powder** may also impart a smooth feel to the skin.

**Code Number:** M16002

**INCI Nomenclature:**

*Populus tremuloides* Bark Extract

**INCI Status:** Approved

**REACH Status:** Fully Compliant

**CAS Number:** 90083-05-9

**EINECS Number:** 290-199-2

**Origin:** Botanical:

*Populus tremuloides*

**Processing:**

GMO Free

No Ethoxylation

No Irradiation

No Sulphonation

No Ethylene Oxide treatment

No Hydrogenation

**Additives:** None

-Preservatives: None

-Antioxidants: None

**Other additives:** None

**Solvents used:** Water

**Appearance:** Free Flowing, White to Light Yellow Powder

**Soluble/Miscible:** Fully Water Soluble

**Suggested Use Levels:** 0.2 - 3.0%

**Suggested Applications:**

Skin Conditioning & Antimicrobial

# PhytoCide Aspen Bark Extract Powder

**PhytoCide Aspen Bark Extract Powder** was evaluated for its ability to accelerate cell renewal by means of a traditional Dansyl Chloride protocol. The results indicate that 2.0% **PhytoCide Aspen Bark Extract Powder** is capable of increasing cellular renewal by 26.0% when compared to the untreated biological control and increases cellular renewal 13.5% faster than using 1.0% Salicylic Acid in a solution. Therefore, we can assume that products incorporating **PhytoCide Aspen Bark Extract Powder** are capable of exfoliating the skin for a smoother surface aesthetic.

## Increase in Cellular Renewal Rate

Figure 1. Cellular renewal results for 2.0% **PhytoCide Aspen Bark Extract**.

One of the first steps in the development of this product was to determine the peptide's potential ability to inhibit the growth of a variety of bacteria and fungi. Using standard serial dilution protocols in growth media, the Minimum Inhibitory Concentrations (MICs) for **PhytoCide Aspen Bark Extract Powder** were determined for a variety of both bacterial and fungal organisms. The results of these tests are shown in Figure 2.

Microorganism Tested	MIC (%)
<i>E. coli</i>	1.00
<i>P. aeruginosa</i>	1.00
<i>S. aureus</i>	2.00
<i>C. albicans</i>	1.00
<i>A. brasiliensis</i>	1.00

Figure 2. MIC Data for **PhytoCide Aspen Bark Extract Powder**.

# PhytoCide Aspen Bark Extract Powder

The positive MIC screening results warranted further testing to confirm its ability to provide product preservation. A Double Challenge Test was completed using 2.0% **PhytoCide Aspen Bark Extract Powder** in a generic cream base formulation at pH 5. Samples were inoculated with *E. coli*, *P. aeruginosa*, *S. aureus*, *C. albicans*, and *A. brasiliensis*. During the first 28-day incubation period, samples were periodically collected and tested for the presence of these microorganisms. Following this initial 28 days of incubation, the cream samples were then re-inoculated with the microbial cultures and sampled over an additional 28-day period. Figure 3 shows the positive preservation results for 2.0% **PhytoCide Aspen Bark Extract Powder**.

## 2.0% PhytoCide Aspen Bark Extract Powder in Cream Formula Challenge Test - pH 5

Figure 3. Challenge Test results for Generic Cream Formula pH 5 with 2.0% **PhytoCide Aspen Bark Extract Powder** inoculated on Day 0 and re-inoculated on Day 28. Results show log reduction in viable organisms.

A Time Kill Test was performed to determine the change in population of aerobic microorganisms within a specified sampling time when tested against 2.0% **PhytoCide Aspen Bark Extract Powder** solution. The activity of the test material inoculated was evaluated at determine time intervals of 30 seconds, 1, 5, 10 and 30 minutes after the inoculation to determine quantitatively the number of viable microorganisms remaining after the incubation time. As shown in Figure 4, the Gram-positive and Gram-negative bacteria as well as the yeast and mold were reduced by 99.9% within 30 seconds interval of the test after the inoculation.

# PhytoCide Aspen Bark Extract Powder

## 2.0% PhytoCide Aspen Bark Extract Powder Time Kill Test

Figure 4. Time Kill Test results for 2.0% **PhytoCide Aspen Bark Extract Powder**.

## USE RECOMMENDATIONS

**PhytoCide Aspen Bark Extract Powder** is water soluble and may therefore be added to aqueous systems, as well as the aqueous phase of emulsions. When using **PhytoCide Aspen Bark Extract Powder** it is recommended to maintain the formulation pH between 3 and 9. We also suggest incorporating the product at temperatures of 60°C or below.

## Specification

**Tradename:** PhytoCide Aspen Bark Extract Powder

**Code:** M16002

**Test Request Form #:** 975

**Sponsor:** Active Micro Technologies; 107 Technology Drive Lincolnton, NC 28092

**Study Director:** Erica Segura

**Principle Investigator:** Meghan Darley

### Abstract

**PhytoCide Aspen Bark Extract Powder** was evaluated for its ability to accelerate cell renewal by means of a traditional Dansyl Chloride protocol.

### Methods & Materials

A 5% Dansyl Chloride was prepared by dispersing Dansyl Chloride 95% (Sigma) in petrolatum. Approximately 0.2 g of the ointment was applied to three 2cm x 2cm locations on the volar forearm of 12 (M/F) subjects between the ages of 19 and 43. The material was allowed to remain in place for 24 hours at which time any excess ointment was removed.

Two products were tested, with the remaining untreated site serving as the biological control. The products were applied in a randomized fashion. Approximately 50  $\mu$ l of product was applied to the appropriate test site once per day. The sites were then examined daily under ultraviolet light (SL-3660 Long Wave Ultra Violet, Black Light Eastern Corp., Westbury, Long Island, NY) for fluorescence. The test was continued until no fluorescence was detectable at any site. The values listed reflect the average time for each product.

### Results:

Material	Concentration	% Cell Renewal
Salicylic Acid	1%	22.5%
Untreated Control	N/A	0
PhytoCide Aspen Bark Extract Powder	2%	26.0%

### Discussion

The results indicate that **PhytoCide Aspen Bark Extract Powder** is capable of increasing cellular renewal by 26% when compared to the untreated biological control and increases cellular renewal 13.5% faster than using 1.0% Salicylic Acid in a solution. Therefore, we can assume that products incorporating PhytoCide Aspen Bark Extract Powder are capable of exfoliating the skin for a smoother surface aesthetic.

## Antimicrobial Efficacy Test PCPC Section 20 Method 3

Determination of Preservation Adequacy of Water- Miscible Personal Care Products

### Test Product

PhytoCide Aspen Bark Extract Powder  
Code: M16002

### Purpose

This study was initiated to determine the efficacy of a cosmetic ingredient with antimicrobial properties in a cream formulation against bioburden as a function of time.

### Study Dates

The study was started on March 24<sup>th</sup>, 2014 and was completed on May 30<sup>th</sup>, 2014.

### Test Organisms

1. *Escherichia coli*: ATCC #8739
2. *Pseudomonas aeruginosa*: ATCC #9027
3. *Staphylococcus aureus*: ATCC #6538
4. *Aspergillus niger*: ATCC #16404
5. *Candida albicans*: ATCC #10231

### Neutralization:

Verification of neutralization of the antimicrobial properties of the product was demonstrated prior to performing the test for microbial content by inoculating the product dilution with a low level of challenge microorganisms (100 CFU) and verifying recovery of this viable inoculum. This provides evidence that the antimicrobial has been neutralized and there are no false positive results during the Challenge Test.

### Test Method

Fifty grams of Generic Cream pH 5 with 2% PhytoCide Aspen Bark Extract Powder was weighed into five individual containers. Each container was inoculated with one of the five test organisms. The inoculum concentration for each organism was standardized using the 0.5 McFarland turbidity standard and further diluted to yield approximately  $10^6$  to  $10^8$  microorganisms/ml. The amount of each inoculum added to each sample was no more than 1% of the product weight, as to not alter the product composition.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## Challenge Test with 2.0% PhytoCide Aspen Bark Extract Powder

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

The inoculated samples were evaluated 0, 7, 14, 21, and 28 days after the initial inoculation to determine quantitatively the number of viable microorganisms remaining. On the 28<sup>th</sup> day of testing the samples were re-inoculated and evaluated 7, 14, 21, and 28 days after the second exposure to determine the number of viable microorganisms. The table below represents the percent reduction of viable organisms after being introduced into the test formulation.

<b>Organisms</b>					
Inoculum (initial) CFU/ml	<i>E. coli</i>	<i>P. aeruginosa</i>	<i>S. aureus</i>	<i>A. brasiliensis</i>	<i>C. albicans</i>
	1.2 x 10 <sup>6</sup>	2.1 x 10 <sup>4</sup>	8.0 x 10 <sup>5</sup>	1.3 x 10 <sup>4</sup>	1.8 x 10 <sup>4</sup>
Day 0	99.967%	>99.999%	99.525%	99.462%	95.444%
Day 7	>99.999%	>99.999%	99.998%	99.385%	99.889%
Day 14	>99.999%	>99.999%	>99.999%	99.462%	>99.999%
Day 21	>99.999%	>99.999%	>99.999%	99.846%	>99.999%
Day 28	>99.999%	>99.999%	>99.999%	99.769%	>99.999%
Inoculum (re-inoculated) CFU/ml	1.7 x 10 <sup>6</sup>	9.9 x 10 <sup>4</sup>	2.1 x 10 <sup>6</sup>	2.0 x 10 <sup>5</sup>	1.1 x 10 <sup>5</sup>
Day 7	>99.999%	>99.999%	99.995%	98.500%	>99.999%
Day 14	>99.999%	>99.999%	>99.999%	92.500%	>99.999%
Day 21	>99.999%	>99.999%	>99.999%	99.000%	>99.999%
Day 28	>99.999%	>99.999%	>99.999%	99.850%	>99.999%

Table 1. Challenge Test results for Generic Cream pH 5 with 2% PhytoCide Aspen Bark Extract Powder inoculated on Day 7, 14, 21 and 28 then re-inoculated and tested on Day 7, 14, 21 and 28.

\* The days listed in the first column refer to the inoculum/plating day. Bacteria results are read 2 days after plating day, and mold and yeast results are read 5 days after plating day.

### **Results & Discussion**

The results obtained from the Neutralization Test of each product using Dey/Engley (D/E) broth, indicate that the neutralization steps conducted prior to performing the Challenge Test are indeed effective for avoiding false positive Challenge Test results.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## Challenge Test with 2.0% PhytoCide Aspen Bark Extract Powder

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

---

The results of this Challenge Test demonstrate the effectiveness of the preservation system used in Generic Cream pH 5 with 2% PhytoCide Aspen Bark Extract Powder. The recommendations stated in Section 13, Determination of Preservative Adequacy in Cosmetic Formulations, in the PCPC Microbiology Guidelines are as follows:

Bacteria – There should be at least a 99.9% (3 log) reduction of vegetative bacteria within 7 days following each challenge and no increase for the duration of the test period.

Yeasts and Molds – There should be at least a 90% (1 log) reduction of yeasts and molds within 7 days following each challenge and no increase for the duration of the test period.

The Gram positive and Gram negative bacteria as well as the yeast were reduced by greater than 99.9% within 7 days of each challenge. The mold was reduced by greater than 90% within 7 days of each challenge. By the end of each 28-day test period Gram positive and Gram negative bacteria as well as the yeast were reduced by 99.999% or greater. Mold was reduced by 99.0% or greater.

## Challenge Test with 2.0% PhytoCide Aspen Bark Extract Powder

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

Phase	Ingredient	Supplier	%
I	Water	-	85.5
	Glycerin	PT. Musim Mas	5.0
	Stearic Acid	Acme Hardesty Oleochemicals	2.5
II	Mineral Oil	RITA	5.0
	Lanolin	RITA	0.5
	Petrolatum	RITA	0.5
	Sepigel 305	Seppic	1.0

### **Manufacturing Process:**

1. Phase I:

Charge water into main beaker and begin propeller mixing. A vortex should form. Begin heating to 80°C while adding the ingredients.

2. Phase II:

In a separate beaker, combine ingredients and heat to 80°C while mixing. Mix until homogenous. Then add to the main beaker with high-speed mixing. Maintain temperature at 80°C and mix for 15 minutes. Begin force cooling to 25°C.

3. Check the pH and adjust it if necessary.

### **Specifications:**

Appearance: White to Off-White Emulsion

pH: 5.0 – 8.0

\*If a different pH is desired, adjust using Citric Acid (50%) or NaOH (25%). Formula is stable in the 3.0 – 7.0 pH range.

### **Antimicrobial Efficacy (Challenge) Testing**

The intent of performing an Antimicrobial Efficacy or Challenge test is to evaluate whether an antimicrobial agent or preservation system in a given cosmetic formulation has the ability to prevent the growth of test microorganisms. The test methodology employed by Active Micro Technologies (AMT) is based on the methods published in the CTFA Microbiology Guidelines. AMT's goal is to assist our customers by providing a screening test of a product formulation that is approaching finalization. It is expected that the formulation(s) submitted for Challenge testing contain AMT antimicrobials and have already passed the customer's internal stability tests. It is also anticipated that formal challenge testing of the final formulation will subsequently be performed by the customer at an outside lab of their choosing.

The information contained in this report is provided by Active Micro Technologies after the exercise of all reasonable care and skill in its compilation, preparation, and issue. It is provided without liability regarding its subsequent application and use. This type of screening test will be conducted only for validation of the efficacy of the antimicrobial agent or preservative system in the specific formulation tested. It does not address the suitability of the overall formula, nor does it address the regulatory status of any component therein. This testing does not account for the possibility of environmental microorganisms and cannot be relied upon as sufficient to justify commercialization of the product tested. By submitting samples for testing, the customer acknowledges that they will not hold Active Micro Technologies responsible for products launched based solely on the support of these studies.

# PhytoCide Aspen Bark Extract Powder Efficacy vs. *Propionibacterium acnes*

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

---

## Abstract

*Propionibacterium acnes* is a gram positive, non-spore-forming, microaerophilic, rod-shaped bacterium that is a common inhabitant of human skin. This microorganism metabolizes fatty acids created by sebaceous glands. The combination of fatty acid metabolites and antigens produced by the bacteria can create intense localized areas of inflammation that can fracture hair follicles. As a consequence, lesions develop on the surface of the skin in the form of pustules. This condition is commonly known as acne.

The purpose of this study was to determine the bactericidal efficacy of **PhytoCide Aspen Bark Extract Powder** against *P. acnes* by establishing the minimum inhibitory concentration (MIC) required to inhibit its growth and proliferation. For comparative purposes, an over-the-counter acne treatment product was used as a benchmark. According to the MIC results, **PhytoCide Aspen Bark Extract Powder** is capable of effectively inhibiting the growth of *P. acnes* at a significantly lower concentration than that of the benchmark product.

## Materials and Methods

The products tested were a 35% solution of **PhytoCide Aspen Bark Extract Powder** and an over-the-counter, deep cleaning astringent that contains 2% salicylic acid (Benchmark). Each product was tested by preparing a serial dilution in a growth medium, beginning with an initial product concentration of 100%.

To determine the Minimum Inhibitory Concentration (MIC) of each product against *P. acnes*, a standard 9% saline solution was added to a test tube using a sterile pipette. Enough bacteria were added to the saline solution using a sterile loop to match the turbidity of a 0.5 McFarland standard. Two milliliters of this bacterial suspension were then transferred to one additional milliliter of 9% saline solution. Afterwards, 300  $\mu\text{L}$  of the diluted mixture were added to 30 ml of sterile water yielding a final bacterial concentration of approximately  $10^6$  colony forming units (cfu)/ml. Using an 8-tip pipettor, 150  $\mu\text{L}$  of double strength Tryptic Soy Broth (TSB) were added to the first row of wells in a sterile microwell plate. Then, 150  $\mu\text{L}$  of single strength TSB were pipetted into the remaining rows of the plate.

150  $\mu\text{L}$  of the **PhytoCide Aspen Bark Extract Powder** solution was pipetted into the first row of wells containing the double-strength TSB and mixed 5 times. 150  $\mu\text{L}$  of this mixed material from the first row were then transferred via pipettor into the second row of wells and mixed 5 times. This procedure was repeated for each subsequent row, creating a serial dilution of the **PhytoCide Aspen Bark Extract Powder** solution ranging from 50% to 0.05% concentration through the first 11 rows of the plate. The last row did not receive any of the serially diluted **PhytoCide Aspen Bark Extract Powder** solution. This twelfth row, containing only single strength TSB, served as a positive control to demonstrate the viability of the diluted bacterial culture used to inoculate the plate. This same procedure was then repeated using the over-the-counter benchmark product.

Each plate was inoculated using an inoculating plate that had been dipped in the *P. acnes* inoculum suspension, prepared as previously described. The plates were incubated for 48 hours at 35 +/- 2°C. After the 48-hour incubation period the plates were examined for microbial growth, indicated by turbidity in the wells. The row of wells with the lowest concentration of tested product that remained clear (i.e., inhibited growth) was used to establish the MIC value.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied. This information is offered solely for your investigation, verification, and consideration.

The following formula was used to calculate the MIC values:

$$\% \text{ MIC} = \frac{\text{Initial product concentration (\% in Row 1)}}{2^{(\text{last no growth row})}}$$

## Results

MIC Results		
Product Tested	Last Clear Row	% MIC
PhytoCide Aspen Bark Extract Powder Solution	6	1.563
Benchmark product	3	12.500

Table 1. MIC Results

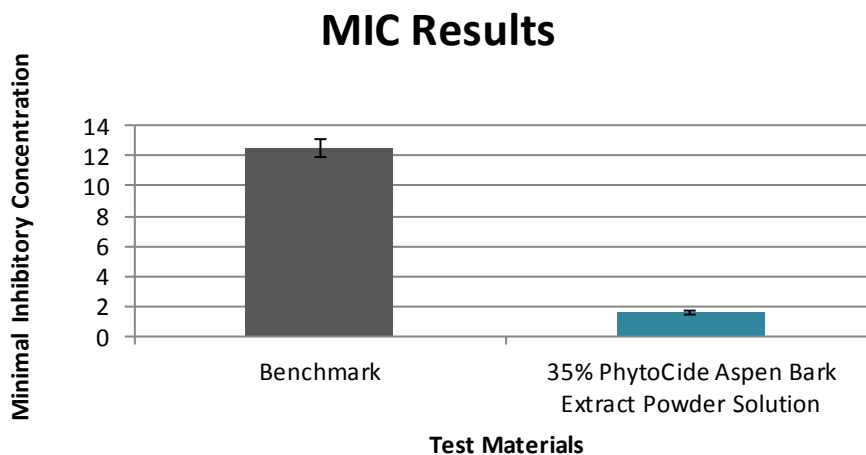

Figure 1. MIC Results

## Discussion

Based on these results, we can confirm that **PhytoCide Aspen Bark Extract Powder** is capable of inhibiting the growth of *Propionibacterium acnes* when used at a concentration of approximately 1.5%. This concentration is significantly lower than the 12.5% concentration that is required to equally inhibit growth when using the benchmark product containing 2% salicylic acid.

*P. acnes* has been identified as a primary factor that causes acne. By inhibiting the proliferation of this bacterium, one may significantly minimize acne formation. **PhytoCide Aspen Bark Extract Powder** is a broad-spectrum antimicrobial that has been shown to be effective against the acne-causing bacterium *Propionibacterium acnes*. These properties make **PhytoCide Aspen Bark Extract Powder** an effective ingredient for formulations developed to address problem skin.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied. This information is offered solely for your investigation, verification, and consideration.

## **Time Kill Test**

### **E2315**

#### **Assessment of Antimicrobial Activity Using a Time Kill Procedure**

#### **Product**

PhytoCide Aspen Bark Extract Powder

#### **Test Request #:**

1884

#### **Purpose**

This study was initiated to measure the change in population of aerobic microorganisms within a specified sampling time when tested against a cosmetic ingredient.

#### **Study Dates**

The study was started on April 6<sup>th</sup>, 2016 and was completed on April 11<sup>th</sup>, 2016.

#### **Test Organisms**

1. *Escherichia coli*: ATCC #8739
2. *Pseudomonas aeruginosa*: ATCC #9027
3. *Staphylococcus aureus*: ATCC #6538
4. *Bacillus subtilis*: ATCC #6051
5. *Aspergillus brasiliensis*: ATCC #16404
6. *Candida albicans*: ATCC #10231

#### **Neutralization:**

Inactivation of the antimicrobial activity of the test material is achieved through the dilution of the test material during the sampling time at specified sampling intervals.

## **Test Method**

Ten grams of 4% PhytoCide Aspen Bark Extract Powder solution was weighed into six individual containers. Each container was inoculated with one of the six test organisms. The inoculum concentration for each organism was standardized using the 0.5 McFarland turbidity standard and further diluted to yield approximately  $10^6$  microorganisms/ml. The amount of each inoculum added to each sample was no more than 1% of the product weight, as to not alter the product composition. Serial dilutions from each container were performed to enumerate the surviving microorganisms using the Plate Count Technique.

The activity of the test material inoculated was evaluated at determine time intervals of 30 seconds, 1, 5, 10 and 30 minutes after the inoculation to determine quantitatively the number of viable microorganisms remaining after the incubation time.

Organisms	Inoculum Concentration CFU/ml	Percentage of Reduction				
		30 seconds	1 minute	5 minute	10 minute	30 minutes
<i>E.coli</i> * ATCC# 8739	$2.6 \times 10^6$	99.9%	99.9%	99.9%	99.9%	99.9%
<i>S.aureus</i> ATCC# 6538	$2.1 \times 10^6$	99.9%	99.9%	99.9%	99.9%	99.9%
<i>P.aeruginosa</i> ATCC# 9027	$3.2 \times 10^5$	99.9%	99.9%	99.9%	99.9%	99.9%
<i>B.subtilis</i> ATCC# 6051	$2.5 \times 10^5$	99.9%	99.9%	99.9%	99.9%	99.9%
<i>A.brasiliensis</i> ATCC# 16404	$1.2 \times 10^5$	99.9%	99.9%	99.9%	99.9%	99.9%
<i>C.albicans</i> ATCC# 10231	$1.0 \times 10^5$	99.9%	99.9%	99.9%	99.9%	99.9%

Table 1. Time Kill Test results for 4% PhytoCide Aspen Bark Extract Powder inoculated with  $10^6$  microorganisms' population. Results show % reduction in viable organisms after inoculation and sampling time intervals.

\*Bacteria results are read 2 days after plating day, and mold and yeast results are read 5 days after plating day.

---

## **Results & Discussion**

The results of this Time Kill Test determine the changes in population of aerobic microorganisms within a specified sampling time when tested against 4% PhytoCide Aspen Bark Extract Powder solution.

The Gram positive and Gram negative bacteria as well as the yeast and mold were reduced by 99.9% within 30 seconds interval of the test after the inoculation.

Product Name: PhytoCide Aspen Bark Extract Powder

Code: M16002

INCI Name: *Populus tremuloides* Bark Extract

Aspen Bark contains a variety of phenolic compounds, but is notably rich in salicylates.<sup>1</sup> PhytoCide Aspen Bark Extract Powder contains a minimum of 54.0% of salicylates with an average content of 56.7%. This salicylate content is measured using HPLC (High Performance Liquid Chromatography). Due to the required test method and its associated mobile phase, the pH of the test sample is lowered from its natural pH. When salicylates are exposed to an acidic environment, they convert into salicylic acid. Therefore when testing for salicylate content of PhytoCide Aspen Bark Extract Powder using HPLC, the value is quantified as the percent of salicylic acid as an artifact of the test method; although no salicylic acid actually exists in the product.

Aspen bark extracts and willow bark extracts are very common cosmetic ingredients as they share similar phenolic glycoside compositions and functionality. Similarly, both species of woody trees contain high natural salicylate distribution within their bark and leaves.<sup>1,2</sup> Because *Salix* bark extracts have been long used in the cosmetic industry and they are known to have a high natural salicylate content similar to the *Populus* species, we are able to use existing toxicological information to infer the safety of aspen bark extracts.

The European Medicines Agency has completed an *Assessment Report on Salicis Cortex (Willow Bark) and Herbal Preparation (s) Thereof with Well-Established Use and Traditional Use* which outlines a wide variety of pharmacological and toxicological findings when taken orally. When comparing the *Populus* and *Salix* species, we can expect that this report would classify PhytoCide Aspen Bark Extract Powder as a quantifiable herbal preparation as it would willow bark extracts.<sup>3</sup> Willow bark extracts must contain a minimum 5.0% of total salicylic derivatives to be considered for this type of use as determined by European Pharmacopoeia (04/2008:2312). PhytoCide Aspen Bark Extract Powder is quantified to contain a minimum of 54% salicylates which is well within the parameters of this classification.<sup>3</sup>

PhytoCide Aspen Bark Extract Powder is a natural antimicrobial used for topical applications. A Human Subject Repeat Insult Patch Test (HRIPT) evaluation was completed to determine if PhytoCide Aspen Bark Extract Powder would be classified as an irritant or sensitizing agent. The powder was diluted to a 5% solution in water and 0.2 grams was applied to an area of 1cm<sup>2</sup>. The procedure was repeated until a series of nine consecutive 'open patch' applications were made every Monday, Wednesday, and Friday for three consecutive weeks. Under the reported testing conditions, results indicated that PhytoCide Aspen Bark Extract Powder was not a primary sensitizer and a non-irritating material. Please find attached a copy of these results.

---

Additionally, an *In vitro* ocular irritation study was conducted to evaluate whether PhytoCide Aspen Bark Extract Powder would induce ocular irritation in the EpiOcular™ model assay. Test substances were applied to the tissue inserts and incubated. Cell viability was measured by dehydrogenase conversion of MTT, present in cell mitochondria, into blue formazan salt that is measured after extraction from the tissue. The irritation potential of the test chemical was dictated by the reduction in tissue viability of exposed tissues compared to the negative control. Under conditions of this assay, the test article was considered to be non-irritating. Please find attached a copy of those results.

As a result, this knowledge combined with the completed HRIPT study and ocular irritation study, allows us to support the safety of PhytoCide Aspen Bark Extract Powder in cosmetic applications when used at suggested levels of 0.2 – 3.0%. No further testing is required.

## Dermal and Ocular Irritation Tests

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

---

**Tradename:** PhytoCide Aspen Bark Extract Powder

**Code:** M16002

**CAS #:** 90083-05-9

**Test Request Form #:** 279

**Lot #:** 4330

**Sponsor:** Active Concepts, LLC; 107 Technology Drive Lincolnton, NC 28092

**Study Director:** Erica Segura

**Principle Investigator:** Meghan Darley

**Test Performed:**

In Vitro EpiDerm™ Dermal Irritation Test (EPI-200-SIT)

EpiOcular™ Eye Irritation Test (OCL-200-EIT)

### **SUMMARY**

*In vitro* dermal and ocular irritation studies were conducted to evaluate whether **PhytoCide Aspen Bark Extract Powder** would induce dermal or ocular irritation in the EpiDerm™ and EpiOcular™ model assays.

The product was tested according to the manufacture's protocol. The test article solution was found to be a **non-irritant**. Reconstructed human epidermis and cornea epithelial model were incubated in growth media overnight to allow for tissue equilibration after shipping from MatTek Corporation, Ashland, MA. Test substances were applied to the tissue inserts and incubated for 60 minutes for liquid and solid substances in the EpiDerm™ assay and 30 minutes for liquid substances and 90 minutes for solid substances in the EpiOcular™ assay at 37°C, 5% CO<sub>2</sub>, and 95% relative humidity (RH). Tissue inserts were thoroughly washed and transferred to fresh plates with growth media. After post substance dosing incubation is complete, the cell viability test begins. Cell viability is measured by dehydrogenase conversion of MTT [(3-4,5-dimethyl thiazole 2-yl)], present in the cell mitochondria, into blue formazan salt that is measured after extraction from the tissue. The irritation potential of the test chemical is dictated by the reduction in tissue viability of exposed tissues compared to the negative control.

Under the conditions of this assay, the test article was considered to be **non-irritating**. The negative and positive controls performed as anticipated.

### **I. Introduction**

#### **A. Purpose**

*In vitro* dermal and ocular irritation studies were conducted to evaluate whether a test article would induce dermal or ocular irritation in the EpiDerm™ and EpiOcular™ model assays. MatTek Corporation's reconstructed human epidermal and human ocular models are becoming a standard in determining the irritancy potential of test substances. They are able to discriminate between irritants and non-irritants. The EpiDerm™ assay has accuracy for the prediction of UN GHS R38 skin irritating and no-label (non-skin irritating) test substances. The EpiOcular™ assay can differentiate chemicals that have been classified as R36 or R41 from the EU classifications based on Dangerous Substances Directive (DSD) or between the UN GHS Cat 1 and Cat 2 classifications.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## II. Materials

- A. Incubation Conditions:** 37°C at 5% CO<sub>2</sub> and 95% relative humidity
- B. Equipment:** Forma humidified incubator, ESCO biosafety laminar flow hood, Synergy HT Microplate reader; Pipettes
- C. Media/Buffers:** DMEM based medium; DPBS; sterile deionized H<sub>2</sub>O
- D. Preparation:** Pre-incubate (37°C) tissue inserts in assay medium; Place assay medium and MTT diluent at 4°C, MTT concentrate at -20°C, and record lot numbers of kit components
- E. Tissue Culture Plates:** Falcon flat bottom 96-well, 24-well, 12-well, and 6-well tissue culture plates
- F. Reagents:** MTT (1.0mg/mL); Extraction Solution (Isopropanol); SDS (5%); Methyl Acetate
- G. Other:** Nylon Mesh Circles (EPI-MESH); Cotton tip swabs; 1mL tuberculin syringes; Ted Pella micro-spatula; 220mL specimen containers; sterile disposable pipette tips; Parafilm

## III. Test Assay

### **A. Test System**

The reconstructed human epidermal model, EpiDerm™, and cornea epithelial model, EpiOcular™, consist of normal human-derived epidermal keratinocytes which have been cultured to form a multilayer, highly differentiated model of the human epidermis and cornea epithelium. These models consist of organized basal, spinous, and granular layers, and the EpiDerm™ systems also contains a multilayer stratum corneum containing intercellular lamellar lipid layers that the EpiOcular™ system is lacking. Both the EpiDerm™ and EpiOcular™ tissues are cultured on specially prepared cell culture inserts.

### **B. Negative Control**

Sterile DPBS and sterile deionized water are used as negative controls for the EpiDerm™ and EpiOcular™ assays, respectfully.

### **C. Positive Control**

Known dermal and eye irritants, 5% SDS solution and Methyl Acetate, were used as positive controls for the EpiDerm™ and EpiOcular™ assays, respectfully.

### **D. Data Interpretation Procedure**

#### **a. EpiDerm™**

An irritant is predicted if the mean relative tissue viability of the 3 tissues exposed to the test substance is reduced by 50% of the mean viability of the negative controls and a non-irritant's viability is > 50%.

#### **b. EpiOcular™**

An irritant is predicted if the mean relative tissue viability of the 2 tissues exposed to the test substance is reduced by 60% of the mean viability of the negative controls and a non-irritant's viability is > 40%.

## IV. Method

### **A. Tissue Conditioning**

Upon MatTek kit arrival at Active Concepts, LLC the tissue inserts are removed from their shipping medium and transferred into fresh media and tissue culture plates and incubated at 37°C at 5% CO<sub>2</sub> and 95% relative humidity for 60 minutes. After those 60 minutes the inserts are transferred into fresh media and tissue culture plates and incubated at 37°C at 5% CO<sub>2</sub> and 95% relative humidity for an additional 18 to 21 hours.

### B. Test Substance Exposure

#### a. EpiDerm™

30µL (liquid) or 25mg (solid) of the undiluted test substance is applied to 3 tissue inserts and allowed to incubate for 60 minutes in a humidified incubator (37°C, 5% CO<sub>2</sub>, 95% RH).

#### b. EpiOcular™

Each tissue is dosed with 20µL DPBS prior to test substance dosing. 50µL (liquid) or 50mg (solid) of the undiluted test substance is applied to 2 tissue inserts and allowed to incubate for 90 minutes in a humidified incubator (37°C, 5% CO<sub>2</sub>, 95% RH).

### C. Tissue Washing and Post Incubation

#### a. EpiDerm™

All tissue inserts are washed with DPBS, dried with cotton tipped swab, and transferred to fresh media and culture plates. After 24 hours the inserts are again transferred into fresh media and culture plates for an additional 18 to 20 hours.

#### b. EpiOcular™

Tissue inserts are washed with DPBS and immediately transferred into 5mL of assay medium for 12 to 14 minutes. After this soak the inserts are transferred into fresh media and tissue culture plates for 120 minutes for liquid substances and 18 hours for solid substances.

### D. MTT Assay

Tissue inserts are transferred into 300µL MTT media in pre-filled plates and incubated for 3 hours at 37°C, 5% CO<sub>2</sub>, and 95% RH. Inserts are then removed from the MTT medium and placed in 2mL of the extraction solution. The plate is sealed and incubated at room temperature in the dark for 24 hours. After extraction is complete the tissue inserts are pierced with forceps and 2 x 200µL aliquots of the blue formazan solution is transferred into a 96 well plate for Optical Density reading. The spectrophotometer reads the 96-well plate using a wavelength of 570 nm.

## V. Acceptance Criterion

### A. Negative Control

The results of this assay are acceptable if the mean negative control Optical Density (OD<sub>570</sub>) is  $\geq 1.0$  and  $\leq 2.5$  (EpiDerm™) or  $\geq 1.0$  and  $\leq 2.3$  (EpiOcular™).

### B. Positive Control

#### a. EpiDerm™

The assay meets the acceptance criterion if the mean viability of positive control tissues expressed as a % of the negative control is  $\leq 20\%$ .

#### b. EpiOcular™

The assay meets the acceptance criterion if the mean viability of positive control tissues is  $< 60\%$  of control viability.

### C. Standard Deviation

Since each irritancy potential is predicted from the mean viability of 3 tissues for EpiDerm™ and 2 tissues for EpiOcular™, the variability of the replicates should be  $< 18\%$  for EpiDerm™ and  $< 20\%$  EpiOcular™.

## VI. Results

### A. Tissue Characteristics

The tissue inserts included in the MatTek EpiDerm™ and EpiOcular™ assay kits were in good condition, intact, and viable.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## B. Tissue Viability Assay

The results are summarized in Figures 1 and 2. In no case was the tissue viability  $\leq 50\%$  for EpiDerm™ or  $\leq 60\%$  for EpiOcular™ in the presence of the test substance. The negative control mean exhibited acceptable relative tissue viability while the positive control exhibited substantial loss of tissue viability and cell death.

## C. Test Validity

The data obtained from this study met criteria for a valid assay.

## VII. Conclusion

Under the conditions of this assay, the test article substance was considered to be **non-irritating**. The negative and positive controls performed as anticipated.

**50 HUMAN SUBJECT REPEAT INSULT PATCH TEST**  
**SKIN IRRITATION/SENSITIZATION EVALUATION**  
**(Occlusive Patch)**

AMA Ref. No.: MS08.RIPT.L2091O.50.ACTC

Date: February 18, 2008

Sponsor: Active Concepts, LLC  
121 Ethel Road West, Suite 3  
Piscataway, New Jersey 08854

1.0 Objective:

Consumer products or raw materials designed for consistent reapplication to areas of the skin may, under proper conditions, prove to be contact sensitizers or irritants in certain individuals. It is the intention of a Repeat Insult Patch Test (RIPT) to provide a basis for evaluation of this irritation/sensitization potential if such exists.

2.0 Test Material:

2.1 Test Material Description:

On January 11, 2008 one test sample labeled EN080110-F was received from Active Concepts, LLC and assigned AMA Lab No. L-2091.

2.2 Handling:

Upon arrival at AMA Laboratories, Inc., the test material is assigned a unique laboratory code number and entered into a daily log identifying the lot number, sample description, sponsor, date received and tests requested.

Samples are retained for a period of three months beyond submission of final report unless otherwise specified by the sponsor or, if sample is known to be in support of governmental applications, representative retained samples are kept two years beyond final report submission.

Sample disposition is conducted in compliance with appropriate federal, state and local ordinances.

### 2.3 Test Material Evaluation Prerequisite:

Prior to induction of a human test panel, toxicology, microbiology or in-vitro performance spectra may be required to assess the feasibility of commencement as dictated by an Institutional Review Board (IRB) described in Section 3.0.

Sponsor purports that prior to sample submission the following tests were conducted with no adverse results and that the test data are on file on their premises and have not been made available to AMA personnel:

- USP or CTFA Preservative Efficacy Test or equivalent
- 90 Day Accelerated Stability and Container Compatibility Study

### 3.0 Institutional Review Board:

Reference: CFR Title 21 Part 56, Subparts A, B, C, and D. The IRB of AMA Laboratories, Inc., consists of five or more individuals, chosen from within the company for technical expertise and from the local community for lay interaction. The list of IRB members is kept on file at AMA Laboratories, Inc. and is available for inspection during the hours of operation.

### 4.0 Panel Selection:

#### 4.1 Standards for Inclusion in a Study:

- Individuals who are not currently under a doctor's care.
- Individuals free of any dermatological or systemic disorder which would interfere with the results, at the discretion of the Investigator.
- Individuals free of any acute or chronic disease that might interfere with or increase the risk of study participation.
- Individuals who will complete a preliminary medical history form mandated by AMA Laboratories, Inc. and are in general good health.
- Individuals, who will read, understand and sign an informed consent document relating to the specific type of study they are subscribing. Consent forms are kept on file and are available for examination on the premises of AMA Laboratories, Inc. only.
- Individuals able to cooperate with the Investigator and research staff, willing to have test materials applied according to the protocol, and complete the full course of the study.

4.2 Standards for Exclusion from a Study:

- Individuals under 18 years of age.
- Individuals who are currently under a doctor's care.
- Individuals who are currently taking any medication (topical or systemic) that may mask or interfere with the test results.
- Subjects with a history of any acute or chronic disease that might interfere with or increase the risk associated with study participation.
- Individuals diagnosed with chronic skin allergies.
- Female volunteers who indicate that they are pregnant or lactating.

4.3 Recruitment:

Panel selection is accomplished by advertisements in local periodicals, community bulletin boards, phone solicitation, electronic media or any combination thereof.

4.4 Informed Consent and Medical History Forms:

An informed consent was obtained from each volunteer prior to initiating the study describing reasons for the study, possible adverse effects, associated risks and potential benefits of the treatment and their limits of liability. Panelists signed and dated the informed consent document to indicate their authorization to proceed and acknowledge their understanding of the contents. Each subject was assigned a permanent identification number and completed an extensive medical history form. These forms along with the signed consent forms, are available for inspection on the premises of AMA Laboratories, Inc. only. Reference 21 CFR Ch. 1 Part 50, Subpart B.

The parties agree to comply with applicable state and federal privacy laws for the use and disclosure of a subject's personal health information by taking reasonable steps to protect the confidentiality of this information. This obligation shall survive the termination or expiration of this Agreement.

5.0 Population Demographics:

Number of subjects enrolled	52
Number of subjects completing study	50
Age Range	26-64
Sex	Male 7
	Female 45
Race	Caucasian 42
	Hispanic 9
	Asian 1

## 6.0 Equipment:

- Patch Description: Parke-Davis Hypoallergenic Readiness Bandages or the equivalent.
- 1ml volumetric syringe without a needle.

## 7.0 Procedure:

- Subjects are requested to bathe or wash as usual before arrival at the facility.
- 0.2 ml or 0.2g of the test material is dispensed onto the occlusive, hypoallergenic patch.
- The patch is then applied directly to the skin of the infrascapular regions of the back, to the right or left of the midline and the subject is dismissed with instructions not to wet or expose the test area to direct sunlight.
- After 24 hours the patch is removed by the panelist at home.
- This procedure is repeated until a series of nine consecutive 24 hour exposures have been made for every Monday, Wednesday, and Friday for three consecutive weeks.
- In the event of an adverse reaction, the area of erythema and edema is measured. The edema is estimated by the evaluation of the skin with respect to the contour of the unaffected normal skin. Reactions are scored just before applications two through nine and the next test date following application nine. In most instances this is approximately 24 hours after patch removal. Clients are notified immediately in the case of adverse reaction and determination is made as to treatment program if necessary.
- Subjects are then given a 10 - 14 day rest period after which a challenge or retest dose is applied once to a previously unexposed test site. The retest dose is equivalent to any one of the original nine exposures. Reactions are scored 24 and 48 hours after application.
- Comparison is made between the nine inductive responses and the retest dose.

## 8.0 Results:

Please refer to attached Table.

## 9.0 Observations:

No adverse reactions of any kind were noted during the course of this study.

10.0 Archiving:

All original samples, raw data sheets, technician's notebooks, correspondence files and copies of final reports and remaining specimens are maintained on premises of AMA Laboratories, Inc. in limited access storage files marked "Archive". A duplicate disk copy of final reports is separately archived in a bank safe deposit vault.

11.0 Reference:

Appraisal of the Safety of Chemicals in Food, Drugs and Cosmetics, published by The Association of Food and Drug Officials of The United States, 1965 (modified).

12.0 Conclusions:

The test material (AMA Lab. No.: L-2091; Client No.: EN080110-F) when tested under occlusion as described herein, may be considered:

a **NON-PRIMARY IRRITANT** and **NON-PRIMARY SENSITIZER** to the skin according to the reference.

Evaluation Period:

This study was conducted from January 14, 2008  
 through February 15, 2008.

Scoring Scale and Definition of Symbols Shown in Table:

- 0 - No evidence of any effect
- ? - (Barely perceptible) minimal faint (light pink) uniform or spotty erythema
- 1 - (Mild) pink uniform erythema covering most of contact site
- 2 - (Moderate) pink/red erythema visibly uniform in entire contact area
- 3 - (Marked) bright red erythema with accompanying edema, petechiae or papules
- 4 - (Severe) deep red erythema with vesiculation or weeping with or without edema
- D - Patch eliminated due to reaction
- Dc - Discontinued due to absence of subject on application date
- M - Patch applied to an adjacent site after strong test reaction
- N/A - Score is not calculated for subjects discontinued before challenge
- S - Skin stained from pigment in product
- T - Tan

NOTE: All technical employees of AMA LABORATORIES, INC. are required to take and pass a visual discrimination examination conducted by a Board Certified Ophthalmologist using the Farnsworth-Munsell 100 Hue Test as published; which determines a person's ability to discern color against a black background. This test was additionally modified to include a flesh tone background more nearly approaching actual use conditions, wherein erythematous skin is graded according to intensity.

13.0 Quality Assurance Statement:

This study was inspected in accordance with the Standard Operating Procedures of AMA Laboratories, Inc. To assure compliance with the study protocol, the Quality Assurance Unit completed an audit of the study records and report.

### **Test Performed:**

OECD TG 442C: *In Chemico* Skin Sensitization

Direct Peptide Reactivity Assay (DPRA)

### **Introduction**

A skin sensitizer is a substance that will lead to an allergic response following skin contact<sup>1</sup>. Haptenation is the covalent binding of a hapten, or low-molecular weight substance or chemical, to proteins in the skin. This is considered the prominent mechanism which defines a chemical as a sensitizer. Haptenation is described as a "molecular initiating event" in the OECD Adverse Outcome Pathway (AOP) for skin sensitization which summarizes the key events known to be involved in chemically-induced allergic contact dermatitis<sup>2</sup>. The direct peptide reactivity assay (DPRA) is designed to mimic the covalent binding of electrophilic chemicals to nucleophilic centers in skin proteins by quantifying the reactivity of chemicals towards the model synthetic peptides containing cysteine and lysine. The DPRA is able to distinguish sensitizers from non-sensitizer with 82% accuracy (sensitivity of 76%; specificity of 92%)<sup>3</sup>.

This assay was conducted to determine skin sensitization hazard of **PhytoCide Aspen Bark Extract Powder** in accordance with European Union Reference Laboratory for Alternatives to Animal Testing (EURL ECVAM) and OECD Test Guideline 442C.

### **Assay Principle**

The DPRA is an *in chemico* method which addresses peptide reactivity by measuring depletion of synthetic heptapeptides containing either cysteine or lysine following 24 hours incubation with the test substance. The peptide is a custom material containing phenylalanine to aid in detection. Depletion of the peptide in the reaction mixture is measured by HPLC with gradient elution and UV detection at 220 nm. Cysteine and lysine peptide percent depletion values are then calculated and used in a prediction model which allows assigning the test chemical to one of four reactivity classes used to support the discrimination between sensitizers and non-sensitizers.

**Materials**

- A. Equipment:** HPLC-UV (Waters Breeze - Waters 2998 Photodiode Array Detector); Pipettes; Analytical balance
- B. HPLC/Guard Columns:** Agilent Zorbax SB-C18 2.1mm x 100mm x 3.5µm; Phenomenex Security Guard C18 4mm x 2mm
- C. Chemicals:** Trifluoroacetic acid; Ammonium acetate; Ammonium hydroxide; Acetonitrile; Cysteine peptide (Ac-RFAACAA-COOH); Lysine peptide (Ac-RFAAKAA-COOH); Cinnamic aldehyde
- D. Reagents/Buffers:** Sodium phosphate buffer (100mM); Ammonium acetate buffer (100mM)
- E. Other:** Sterile disposable pipette tips

**Methods**

Solution Preparation:

- 0.667mM Cysteine Peptide in 100mM Phosphate Buffer (pH 7.5)
- 0.667mM Lysine Peptide in 100mM Ammonium Acetate Buffer (pH 10.2)
- 100mM Cinnamic Aldehyde in Acetonitrile
- 100mM **PhytoCide Aspen Bark Extract Powder** in Acetonitrile

Reference Controls:

- Reference Control A: For calibration curve accuracy
- Reference Control B: For peptide stability over analysis time of experiment
- Reference Control C: For verification that the solvent does not impact percent peptide depletion

Sample, Reference Control, and Co-Elution Control Preparation:

- Once these solutions have been made they should be incubated at room temperature, protected from light, for 24±2 hours before running HPLC analysis.
- Each chemical should be analyzed in triplicate.

1:10 Ratio, Cysteine Peptide 0.5mM Peptide, 5mM Test Chemical	1:50 Ratio, Lysine Peptide 0.5mM Peptide, 25mM Test Chemical
<ul style="list-style-type: none"> <li>• 750µL Cysteine Peptide Solution (or 100mM Phosphate Buffer, pH 7.5, for Co-Elution Controls)</li> <li>• 200µL Acetonitrile</li> <li>• 50µL Test Chemical Solution (or Acetonitrile for Reference Controls)</li> </ul>	<ul style="list-style-type: none"> <li>• 750µL Lysine Peptide Solution (or 100mM Ammonium Acetate Buffer, pH 10.2, for Co-Elution Controls)</li> <li>• 250µL Test Chemical Solution (or Acetonitrile for Reference Controls)</li> </ul>

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied. This information is offered solely for your investigation, verification, and consideration.

**Calibration Curve:**

- Standards are prepared in a solution of 20% Acetonitrile:Buffer
  - For the Cysteine peptide using the phosphate buffer, pH 7.5
  - For the Lysine peptide using the ammonium acetate buffer, pH 10.2

	Standard 1	Standard 2	Standard 3	Standard 4	Standard 5	Standard 6	Standard 7
mM Peptide	0.534	0.267	0.1335	0.0667	0.0334	0.0167	0.000

**HPLC Analysis:**

- HPLC-UV system should be equilibrated at 30°C with 50% Mobile Phase A (0.1% (v/v) trifluoroacetic acid in water) and 50% Mobile Phase B (0.085% (v/v) trifluoroacetic acid in acetonitrile) for 2 hours
- Absorbance is measured at 220nm
- Flow Conditions:

Time	Flow	%A	%B
0 minutes	0.35 mL/min	90	10
10 minutes	0.35 mL/min	75	25
11 minutes	0.35 mL/min	10	90
13 minutes	0.35 mL/min	10	90
13.5 minutes	0.35 mL/min	90	10
20 minutes	End Run		

**Data and Reporting**
**Acceptance Criteria:**

1. The following criteria must be met for a run to be considered valid:
  - a. Standard calibration curve should have an  $r^2 > 0.99$ .
  - b. Mean percent peptide depletion values of three replicates for the positive control cinnamic aldehyde should be between 60.8% and 100% for the cysteine peptide and between 40.2% and 69% for the lysine peptide and the maximum standard deviation should be <14.9 for the percent cysteine depletion and <11.6 for the percent lysine depletion.
  - c. Mean peptide concentration of reference controls A should be  $0.50 \pm 0.05$  mM and the coefficient of variable of the peptide peak areas for reference B and C in acetonitrile should be <15.0%.
2. The following criteria must be met for a test chemical's results to be considered valid:
  - a. Maximum standard deviation should be <14.9 for percent cysteine depletion and <11.6 for percent lysine depletion.
  - b. Mean peptide concentration of the three reference control C should be  $0.50 \pm 0.05$  mM.

## OECD TG 442C: In Chemico Skin Sensitization

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

Prediction Model:

Cysteine 1:10/Lysine 1:50 Prediction Model		
Mean of Cysteine and Lysine % Depletion	Reactivity Class	Prediction
0% < Mean % Depletion < 6.38%	Minimal Reactivity	Non-sensitizer
6.38% < Mean % Depletion < 22.62%	Low Reactivity	Sensitizer
22.62% < Mean % Depletion < 42.47%	Moderate Reactivity	Sensitizer
42.47% < Mean % Depletion < 100%	High Reactivity	Sensitizer

If co-elution occurs with the lysine peptide, than the cysteine 1:10 prediction model can be used:

Cysteine 1:10 Prediction Model		
Mean of Cysteine and Lysine % Depletion	Reactivity Class	Prediction
0% < Cys % Depletion < 13.89%	Minimal Reactivity	Non-sensitizer
13.89% < Cys % Depletion < 23.09%	Low Reactivity	Sensitizer
23.09% < Cys % Depletion < 98.24%	Moderate Reactivity	Sensitizer
98.24% < Cys % Depletion < 100%	High Reactivity	Sensitizer

### Results and Discussion

The data obtained from this study met criteria for a valid assay and the controls performed as anticipated.

Percent peptide depletion is determined by the following equation:

$$\text{Percent Peptide Depletion} = \left[ 1 - \left( \frac{\text{Peptide Peak Area in Replicate Injection}}{\text{Mean Peptide Peak Area in Reference Controls C}} \right) \right] \times 100$$

Based on HPLC-UV analysis of **PhytoCide Aspen Bark Extract Powder (code M16002)** we can determine that this product is not a sensitizer and will not cause allergic contact dermatitis. The Mean Percent Depletion of Cysteine and Lysine was 2.82% causing minimal reactivity in the assay giving us the prediction of a non-sensitizer.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied. This information is offered solely for your investigation, verification, and consideration.

**Test Performed:**

OECD TG 442D: In Vitro Skin Sensitization  
*ARE-Nrf2 Luciferase Test Method*

### Introduction

Skin sensitization refers to an allergic response following skin contact with the tested chemical, as defined by the United Nations Globally Harmonized System of Classification and Labelling of Chemicals<sup>1</sup>. Substances are classified as skin sensitizers if there is evidence in humans that the substance can lead to sensitization by skin contact or positive results from appropriate tests, both *in vivo* and *in vitro*. Utilization of the KeratinoSens™ cell line allows for valid *in vitro* testing for skin sensitization.

This assay was conducted to determine skin sensitization potential of **PhytoCide Aspen Bark Extract Powder** in accordance with the UN GHS.

### Assay Principle

The ARE-Nrf2 luciferase test method addresses the induction of genes that are regulated by antioxidant response elements (ARE) by skin sensitizers. The Keap1-Nrf2-ARE pathways have been shown to be major regulator of cytoprotective responses to oxidative stress or electrophilic compounds. These pathways are also known to be involved in the cellular processes in skin sensitization. Small electrophilic substances such as skin sensitizers can act on the sensor protein Keap1 (Kelch-like ECH-associated protein 1), by covalent modification of its cysteine residue, resulting in its dissociation from the transcription factor Nrf2 (nuclear factor-erythroid 2-related factor 2). The dissociated Nrf2 can then activate ARE-dependent genes such as those coding for phase II detoxifying enzymes.

The skin sensitization assay utilizes the KeratinoSens™ method which uses an immortalized adherent human keratinocyte cell line (HaCaT cell line) that has been transfected with a selectable plasmid to quantify luciferase gene induction as a measure of activation of Keap1-Nrf2-antioxidant/electrophile response element (ARE). This test method has been validated by independent peer review by the EURL-ECVAM. The addition of a luciferin containing reagent to the cells will react with the luciferase produced in the cell resulting in luminescence which can be quantified with a luminometer.

## Materials

- A. Incubation Conditions:** 37°C at 5% CO<sub>2</sub> and 95% relative humidity (RH)
- B. Equipment:** Humidified incubator; Biosafety laminar flow hood; Microplate Reader; Pipettes
- C. Cell Line:** KeratinoSens™ by Givaudan Schweiz AG
- D. Media/Buffers:** Dulbecco's Modified Eagle Medium (DMEM); Fetal Bovine Serum (FBS); Phosphate Buffered Saline (PBS); Geneticin
- E. Culture Plate:** Flat bottom 96-well tissue culture treated plates
- F. Reagents:** Dimethyl Sulfoxide (DMSO); Cinnamic Aldehyde; ONE-Glo Reagent; 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT); sodium lauryl sulfate (SLS)
- G. Other:** Sterile disposable pipette tips; wash bottles

## Methods

KeratinoSens™ were into seeded four 96-well tissue culture plates and allowed to grow to 80 – 90% confluency in DMEM containing 10% FBS and 500µg/mL G418 geneticin. Twelve test concentrations of **Phytocide Aspen Bark Extract Powder** were prepared in DMSO with a concentration range from 0.98 – 2000 µM. These 12 concentrations were assayed in triplicate in 2 independently performed experiments. The positive control was cinnamic aldehyde for which a series of 5 concentrations prepared in DMSO had final test concentrations of 4 – 64µM. The negative control was a 1% test concentration of DMSO.

24 hour post KeratinoSens™ seeding, the culture media was removed and replaced with fresh media containing 10% FBS without G418 geneticin. 50 µL of the above described test concentrations was added to the appropriate wells. The treated plates were then incubated for 48 hours at 37°C in the presence of 5% CO<sub>2</sub> and 95% relative humidity. After treatment incubation was complete the media was removed and the wells were washed with PBS 3 times.

One of the four plates was used for a cytotoxicity endpoint, where MTT was added to the wells and incubated for 4 hours at 37°C in the presence of 5% CO<sub>2</sub>. SLS was then added to the wells and incubated overnight at room temperature. A spectrometer measured the absorbance at 570 nm. The absorbance values (optical density) were then used to determine the viability of each well by comparing the optical density of each test material treated well to that of the solvent control wells to determine the IC<sub>50</sub> and IC<sub>30</sub> values.

The remaining 3 plates were used in the luciferase induction endpoint of the assay. 100 µL of Promega's ONE-Glo Reagent was added to 100 µL of fresh media containing 10% FBS without geneticin. Cells were incubated for 5 minutes to induce cell lysis and release luciferin into the media. Plates were read with a luminometer and EC<sub>1.5</sub> and maximum response (I<sub>max</sub>) values were obtained.

## Data and Reporting

### Acceptance Criteria:

1. Gene induction obtained with the positive control, cinnamic aldehyde, should be statistically significant above the threshold of 1.5 in at least one of the tested concentrations (from 4 to 64 µM).
2. The EC<sub>1.5</sub> value should be within two standard deviations of the historical mean and the average induction in the three replicates for cinnamic aldehyde at 64 µM should be between 2 and 8.
3. The average coefficient of variability of the luminescence reading for the negative (solvent) control DMSO should be below 20% in each experiment.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

A KeratinoSens™ prediction is considered positive if the following conditions are met:

1. The I<sub>max</sub> is higher than 1.5-fold and statistically significantly higher as compared to the solvent (negative) control
2. The cellular viability is higher than 70% at the lowest concentration with a gene induction above 1.5 fold (i.e., at the EC<sub>1.5</sub> determining concentration)
3. The EC<sub>1.5</sub> value is less than 1000 μM (or < 200 μg/ml for test chemicals with no defined MW)
4. There is an apparent overall dose-response for luciferase induction

## Results

Compound	Classification	EC <sub>1.5</sub> (μM)	IC <sub>50</sub>	I <sub>max</sub>
Cinnamic aldehyde	Sensitizer	19	289.19 μM	31.6
DMSO	Non-Sensitizer	No Induction	243.24 μM	1.2
PhytoCide Aspen Bark Extract Powder	Non-Sensitizer	No Induction	> 1000 μM	0.5

Table 1: Overview of KeratinoSens™ Assay Results

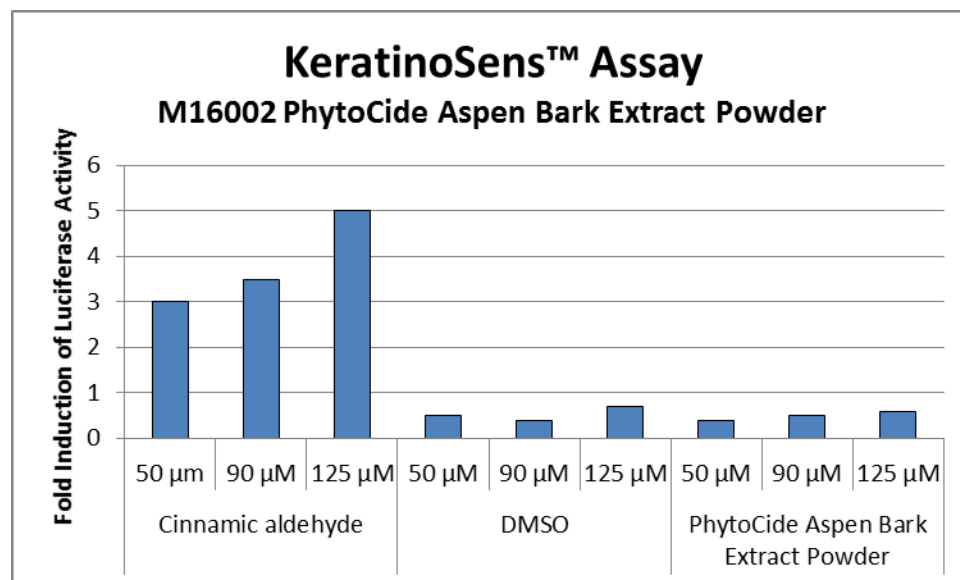

Figure 1: Fold Induction of Luciferase

## Discussion

As shown in the results, **PhytoCide Aspen Bark Extract Powder (code M16002)** was not predicted to be a skin sensitizer based on the KeratinoSens™ ARE-Nrf2 Luciferase Test Method as there was not a significant increase in luciferase expression. It can be concluded that **PhytoCide Aspen Bark Extract Powder** can be safely used in cosmetics and personal care products at typical use levels.

### SUMMARY

A *Salmonella typhimurium*/*Escherichia coli* reverse mutation standard plate incorporation study described by Ames *et al.* (1975) was conducted to evaluate whether a test article in solution **PhytoCide Aspen Bark Extract Powder** would cause mutagenic changes in the average number of revertants for histidine-dependent *Salmonella typhimurium* strains TA98, TA100, TA1537, TA1535 and tryptophan-dependent *Escherichia coli* strain WP2uvrA in the presence and absence of Aroclor-induced rat liver S9. This study was conducted to satisfy, in part, the Genotoxicity requirement of the International Organization for Standardization: Biological Evaluation of Medical Devices, Part 3: Tests for Genotoxicity, Carcinogenicity and Reproductive Toxicity.

The stock test article was tested at eight doses levels along with appropriate vehicle control and positive controls with overnight cultures of tester strains. The test article in solution was found to be noninhibitory to growth of tester strain TA98, TA100, TA1537, TA1535 and WP2uvrA after Spot Inhibition Screen.

Separate tubes containing 2 ml of molten top agar at 45°C supplemented with histidine-biotin solution for the *Salmonella typhimurium* strains and supplemented with tryptophan for *Escherichia coli* strain were inoculated with 100 µl of tester strains, 100 µl of vehicle or test article dilution were added and 500 µl aliquot of S9 homogenate, simulating metabolic activation, was added when necessary. After vortexing, the mixture was poured across the Minimal Glucose Agar (GMA) plates. Parallel testing was also conducted with positive control correspond to each strain, replacing the test article aliquot with 50µl aliquot of appropriate positive control. After the overlay had solidified, the plates were inverted and incubated for 48 hours at 37°C. The mean numbers of revertants of the test plates were compared to the mean number of revertants of the negative control plates for each of the strains tested. The means obtained for the positive controls were used as points of reference.

Under the conditions of this assay, the test article in solution was considered to be Non-Mutagenic to *Salmonella typhimurium* tester strains TA98, TA100, TA1537, TA1535 and *Escherichia coli* tester strain WP2uvrA. The negative and positive controls performed as anticipated. The results of this study should be evaluated in conjunction with other required tests as listed in ISO 100993, Part 3: Tests for Genotoxicity, Carcinogenicity, and Reproductive Toxicology.

### I. Introduction

#### **A. Purpose**

A *Salmonella typhimurium*/*Escherichia coli* reverse mutation standard plate incorporation study was conducted to evaluate whether a test article solution would cause mutagenic changes in the average number of revertants for *Salmonella typhimurium* tester strains TA98, TA100, TA1537, TA1535 and *Escherichia coli* WP2uvrA in the presence and absences of the S9 metabolic activation. Bacterial reverse mutation tests have been widely used as rapid screening procedures for the determination of mutagenic and potential carcinogenic hazards.

## II. Materials

- A. **Storage Conditions:** Room temperature (23-25C).  
 B. **Vehicle:** Sterile DI Water.  
 C. **Preparation:** Eight different doses level were prepared immediately before use with sterile DI water.  
 D. **Solubility/Stability:** 100% Soluble and Stable.  
 E. **Toxicity:** No significant inhibition was observed.

## III. Test System

### **A. Test System**

Each *Salmonella typhimurium* and *Escherichia coli* tester strain contains a specific deep rough mutation (*rfa*), the deletion of *uvrB* gene and the deletion in the *uvrA* gene that increase their ability to detect mutagens, respectively. These genetically altered *Salmonella typhimurium* strains (TA98, TA100, TA1537 and TA1535) and *Escherichia coli* strain (WP2*uvrA*) cannot grow in the absence of histidine and tryptophan, respectively. When placed in a histidine-tryptophan free medium, only those cells which mutate spontaneously back to their wild type states are able to form colonies. The spontaneous mutation rate (or reversion rate) for any one strain is relatively constant, but if a mutagen is added to the test system, the mutation rate is significantly increased.

<u>Tester strain</u>	<u>Mutations/Genotypic Relevance</u>
TA98	hisD3052, Dgal chlD bio <i>uvrB rfa</i> pKM101
TA100	hisG46, Dgal chlD BIO <i>uvrB rfa</i> pKM101
TA1537	hisC3076, <i>rfa</i> , Dgal chlD bio <i>uvrB</i>
TA 1535	hisG46, Dgal chlD bio <i>uvrB rfa</i>
WP2 <i>uvrA</i>	trpE, <i>uvrA</i>

<i>rfa</i>	=	causes partial loss of the lip polysaccharide wall which increases permeability of the cell to large molecules.
<i>uvrB</i>	=	deficient DNA excision-repair system (i.e., ultraviolet sensitivity)
pKM101	=	plasmid confers ampicillin resistance (R-factor) and enhances sensitivity to mutagens.
<i>uvrA</i>	=	All possible transitions and transversions, small deletions.

### **B. Metabolic Activation**

Aroclor induced rat liver (S9) homogenate was used as metabolic activation. The S9 homogenate is prepared from male Sprague Dawley rats. Material is supplied by MOLTOX, Molecular Toxicology, Inc.

### **C. Preparation of Tester strains**

Cultures of *Salmonella typhimurium* TA98, TA100, TA1537, TA1535 and *Escherichia coli* WP2*uvrA* were inoculated to individual flasks containing Oxoid broth No.2. The inoculated broth cultures were incubated at 37°C in an incubator shaker operating at 140-150 rpm for 12-16 hours.

### **D. Negative Control**

Sterile DI water (vehicle without test material) was tested with each tester strain to determine the spontaneous reversion rate. Each strain was tested with and without S9 activation. These data represented a base rate to which the number of revertants colonies that developed in each test plate were compared to determine whether the test material had significant mutagenic properties.

### **E. Positive Control**

A known mutagen for each strain was used as a positive control to demonstrate that tester strains were sensitive to mutation to the wild type state. The positive controls are tested with and without the presence of S9 homogenate.

### **F. Titer of the Strain Cultures:**

Fresh cultures of bacteria were grown up to the late exponential or early stationary phase of growth; to confirm this, serial dilutions from each strain were conducted, indicating that the initial population was in the range of 1 to  $2 \times 10^9$ /ml.

### **IV. Method**

#### **A. Standard Plate Incorporation Assay:**

Separate tubes containing 2 ml of molten top agar supplemented with histidine-biotin solution for the *Salmonella typhimurium* and tryptophan for *Escherichia coli* were inoculated with 100  $\mu$ l of culture for each strain and 100  $\mu$ l of testing solution or vehicle without test material. A 500  $\mu$ l aliquot of S9 homogenate, simulating metabolic activation, was added when necessary. The mixture was poured across Minimal Glucose Agar plates labeled with strain number and S9 activation (+/-). When plating the positive controls, the test article aliquot was replaced by 50  $\mu$ l aliquot of appropriate positive control. The test was conducted per duplicate. The plates were incubated for 37°C for 2 days. Following the incubation period, the revertant colonies on each plate were recorded. The mean number of revertants was determined. The mean numbers of revertants of the test plates were compared to the mean number of revertants of the negative control of each strain used.

### **V. Evaluation**

For the test solution to be evaluated as a test failure or “potential mutagen” there must have been a 2-fold or greater increase in the number of mean revertants over the means obtained from the negative control for any or all strains. Each positive control mean must have exhibited at least a 3-fold increase over the respective negative control mean of the *Salmonella* tester strain used.

### **VI. Results and Discussion**

#### **A. Solubility:**

Water was used as a solvent. Solutions from the test article were made from 0.015 to 50mg/ml.

#### **B. Dose levels tested:**

The maximum dose tested was 5000  $\mu$ g per plate. The dose levels tested were 1.5, 5.0, 15, 50, 150, 500, 1500 and 5000  $\mu$ g per plate.

#### **C. Titer (Organisms/ml):**

$5 \times 10^8$  UFC/ml plate count indicates that the initial population was in the range of 1 to  $2 \times 10^9$  UFC/ml.

#### **C. Standard Plate Incorporation Assay**

In no case was there a 2-fold or greater increase in the mean number of revertant testing strains TA98, TA100, TA1537, TA1535 and WP2uvrA in the presence of the test solution compared with the mean of vehicle control value. The positive controls mean exhibited at least a 3-fold increase over the respective mean of the *Salmonella typhimurium* and *Escherichia coli* tester strains used. The results are summarized in Appendix 2.

### **VII. Conclusion**

All criteria for a valid study were met as described in the protocol. The results of the Bacterial Reverse Mutation Assay indicate that under the conditions of this assay, the test article solution was considered to be Non-Mutagenic to *Salmonella typhimurium* tester strains TA98, TA100, TA1537, TA1535 and *Escherichia coli* WP2uvrA. The negative and positive controls performed as anticipated. The results of this study should be evaluated in conjunction with other required tests as listed in ISO 100993, Part 3: Tests for Genotoxicity, Carcinogenicity, and Reproductive Toxicology.

---

**Tradename:** PhytoCide Aspen Bark Extract Powder

**Code:** M16002

**CAS #:** 90083-05-9

**Test Request Form #:** 1096

**Lot #:** 4728P

**Sponsor:** Active Concepts, LLC; 107 Technology Drive Lincolnton, NC 28092

**Study Director:** Erica Segura

**Principle Investigator:** Meghan Darley

**Test Performed:**

In Vitro EpiDerm™ Model (EPI-200-SIT) Phototoxicity

## **SUMMARY**

*In vitro* phototoxicity irritation studies were conducted to evaluate whether **PhytoCide Aspen Bark Extract Powder** would induce phototoxic irritation in the EpiDerm™ model assay.

The product was tested according to the manufacturer's protocol. The test article solution was found to be a **non-photoirritant** at concentrations of 0.5%, 1.3%, and 4.5%. Reconstructed human epidermis was incubated in growth media for one hour to allow for tissue equilibration after shipping from MatTek Corporation, Ashland, MA. Test substance was applied to the tissue inserts in five varying concentrations and incubated overnight at 37°C, 5% CO<sub>2</sub>, and 95% relative humidity (RH). The following day, the appropriate tissue inserts were irradiated (UVA) for 60 minutes with 1.7 mW/cm<sup>2</sup> (=6 J/cm<sup>2</sup>). After substance incubation, irradiation, and washing was completed, the cell viability test was conducted. Cell viability was measured by dehydrogenase conversion of MTT [(3-4,5-dimethyl thiazole 2-yl)], present in the cell mitochondria, into blue formazan salt that was measured after extraction from the tissue. The photoirritation potential of the test chemical was dictated by the reduction in tissue viability of UVA exposed tissues compared to non-UVA exposed tissues.

Under the conditions of this assay, the test article was considered to be **non-phototoxic** at concentrations of 0.5%, 1.3%, and 4.5%. The negative and positive controls performed as anticipated.

## **I. Introduction**

### **A. Purpose**

*In vitro* dermal phototoxicity study was conducted to evaluate whether a test article would induce photoirritation in the EpiDerm™ model assay. MatTek Corporation's reconstructed human epidermal model is becoming a standard in determining the phototoxicity potential of a test substance. This assay is able to discriminate between photoirritants and non-photoirritants at varying concentrations.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## II. Materials

- A. Incubation Conditions:** 37°C at 5% CO<sub>2</sub> and 95% relative humidity
- B. Equipment:** Forma humidified incubator, ESCO biosafety laminar flow hood, Synergy HT Microplate reader; UVA-vis Irradiation Equipment; UVA meter; Pipettes
- C. Media/Buffers:** Dulbecco's Modified Eagle Medium (DMEM) based medium; Dulbecco's Phosphate-Buffered Saline (DPBS); sterile deionized H<sub>2</sub>O
- D. Preparation:** Pre-incubate (37°C) tissue inserts in assay medium; Place assay medium and MTT diluent at 4°C, MTT concentrate at -20°C, and record lot numbers of kit components
- E. Tissue Culture Plates:** Falcon flat bottom 96-well, 24-well, and 6-well tissue culture plates
- F. Reagents:** MTT (3-4,5-dimethyl thiazole 2-yl) (1.0mg/mL); Extraction Solution (Isopropanol); Chlorpromazine; Triton X-100 (1%)
- G. Other:** Wash bottle; sterile disposable pipette tips; Parafilm; forceps

## III. Test Assay

### A. Test System

The reconstructed human epidermal model, EpiDerm™ consists of normal human-derived epidermal keratinocytes which have been cultured to form a multilayer, highly differentiated model of the human epidermis. This model consists of organized basal, spinous, and granular layers, and contains a multilayer stratum corneum containing intercellular lamellar lipid layers. The EpiDerm™ tissues are cultured on specially prepared cell culture inserts.

### B. Negative Control

Sterile deionized water is used as the negative controls for the EpiDerm™ Phototoxicity assay.

### C. Positive Control

Concentrations of chlorpromazine, ranging from 0.001% to 0.1%, were used as positive controls for the EpiDerm™ Phototoxicity assay.

### D. Data Interpretation Procedure

A photoirritant is predicted if the mean relative tissue viability of the 2 tissues exposed to the test substance and 60 minutes of 6 J/cm<sup>2</sup> is reduced by 20% compared to the non-irradiated control tissues.

## IV. Method

### A. Tissue Conditioning

Upon MatTek kit arrival at Active Micro Technologies, LLC the tissue inserts are removed from their shipping medium and transferred into fresh media and tissue culture plates and incubated at 37°C at 5% CO<sub>2</sub> and 95% relative humidity for 60 minutes. After those 60 minutes the inserts are transferred into fresh media and tissue culture plates and tissue insert dosing begins.

### B. Test Substance Exposure

50µL of the diluted test substance in their respective concentrations are applied to 2 tissue inserts and allowed to incubate for overnight in a humidified incubator (37°C, 5% CO<sub>2</sub>, 95% RH).

## C. Tissue Irradiation

Tissue inserts in their 6-well plates are UVA-irradiated for 60 minutes with 6 J/cm<sup>2</sup> at room temperature. The non-irradiated tissue inserts are incubated at room temperature in the dark.

## D. Tissue Washing and Post Incubation

After UVA-irradiation and dark incubation is complete the tissue inserts are washed using sterile DPBS and transferred to fresh 6-well plates and media for overnight incubation at 37°C, 5% CO<sub>2</sub>, 95% RH.

## E. MTT Assay

Tissue inserts are transferred into 300µL MTT media in pre-filled plates and incubated for 3 hours at 37°C, 5% CO<sub>2</sub>, and 95% RH. Inserts are then removed from the MTT medium and placed in 2mL of the extraction solution. The plate is sealed and incubated at room temperature in the dark for 24 hours. After extraction is complete the tissue inserts are pierced with forceps and 2 x 200µL aliquots of the blue formazan solution is transferred into a 96 well plate for Optical Density reading. The spectrophotometer reads the 96-well plate using a wavelength of 570 nm.

## V. Acceptance Criterion

### A. Negative Control

The results of this assay are acceptable if the mean negative control Optical Density (OD<sub>570</sub>) is ≥ 0.8.

### B. Positive Control

The assay meets the acceptance criterion if a dose dependent reduction in cell viability in the UVA-irradiated tissues is between 0.00316% and 0.0316%.

### C. Standard Deviation

Since the phototoxicity potential is predicted from the mean viability of 2 tissues for the EpiDerm™ Phototoxicity Protocol, the variability of the replicates should not exceed 30%.

## VI. Results

### A. Tissue Characteristics

The tissue inserts included in the MatTek EpiDerm™ assay kit were in good condition, intact, and viable.

### B. Tissue Viability Assay

The results are summarized in Figure 1. Cell viability is calculated for each tissue as a percentage of the corresponding vehicle control either irradiated or non-irradiated. Tissue viability was not reduced by 20% in the presence of the test substance and UVA-irradiation at concentrations of 0.5%, 1.3%, and 4.5%. The negative control mean exhibited acceptable relative tissue viability while the positive control exhibited dose dependent loss of tissue viability and cell death.

### C. Test Validity

The data obtained from this study met criteria for a valid assay. The negative and positive controls performed as anticipated.

## VII. Conclusion

Phototoxicity (photoirritation) is defined as an acute toxic response that is elicited after exposure of the skin to certain chemicals and subsequent exposure to light. Under the conditions of this assay, the test article substance was considered to be **non-phototoxic** at concentrations of 0.5%, 1.3%, and 4.5%. There is a decrease in viability at the 12% test concentration with and without irradiation but this concentration is significantly higher than the suggested use levels. We can safely say that **PhytoCide Aspen Bark Extract Powder** is not a photoirritant when used at the suggested use levels of 0.2 – 3%.

**Test Performed:**

OECD 202

*Daphnia* spp. Acute Immobilization Test

## Introduction

The purpose of the present study is to determine the toxicity of **PhytoCide Aspen Bark Extract Powder** by exposing *Daphnia* spp. to the test substance for 48 hours and measuring the immobilization rate against the control. The present study defines an organism as being immobilized when it does not move for 15 seconds after the test vessel is gently shaken.

OECD Guideline 202 on “*Daphnia* spp., Acute Immobilization Test and Reproduction Test”, adopted in 1984, included two parts: Part I – the 24 hour EC<sub>50</sub> acute immobilization test and Part II – the reproduction test (at least 14 days). Revision of the reproduction test resulted in the adoption and publication of Test Guideline 211 on “*Daphnia magna* Reproduction Test” in September 1998. Consequently, the new version of Guideline 202 is restricted to the acute immobilization test.

## Assay Principle

Young daphnids, aged less than 24 hours at the start of the test, are exposed to the test substance at a range of concentrations for a period of 48 hours. Immobilization is recorded at 24 hours and 48 hours and compared with control values. The results are analyzed in order to calculate the EC<sub>50</sub> at 48 hours. EC<sub>50</sub> is the concentration estimated to immobilize 50% of the daphnids within a stated exposure period. Immobilization refers to those animals that are not able to swim within 15 seconds after gentle agitation of the test vessel, even if they can still move their antennae.

The water solubility and vapor pressure of the test substance should be known. A reliable analytical method for the quantification of the substance in the test solutions with reported recovery efficiency and limit of determination should also be available.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

A reference substance may be tested for EC<sub>50</sub> as a means of assuring that the test conditions are reliable.

For this assay to be valid, the following performance criteria apply:

- In the control, not more than 10% of the daphnids should have been immobilized.
- The dissolved oxygen concentration at the end of the test should be at least 3 mg/L in control and test vessels.

## Materials

- Glass Test Tubes and/or Beakers
- Dissolved Oxygen Meter
- pH Meter
- Temperature Control Apparatus
- Total Organic Carbon (TOC) Analyzer
- Chemical Oxygen Demand (COD) Analyzer
- *Daphnia magna* Straus
  - Use organisms less than 24 hours old. Do not use first offspring of parents.
- Water
  - Use water suitable for culturing and testing *Daphnia* spp. It can be natural water (surface water or groundwater), dechlorinated tap water, or artificially prepared water (Table 1), but must satisfy the conditions listed in Table 2. Do not use Elendt M4 or M7 media or water containing chelating agents for testing metal-containing substances. The water hardness should be 250 mg/L or smaller in terms of calcium carbonate concentration, and the pH should be 6-9. Aerate the material water before using it for the test.

Substance	Concentration
Particulate Matter	<20 mg/L
Total Organic Carbon	<2 mg/L
Unionized Ammonia	<1 ug/L
Residual Chlorine	<10 ug/L
Total Organophosphorus Pesticides	<50 ng/L
Total Organochlorine Pesticides plus Polychlorinated Biphenyls	<50 ng/L
Total Organic Chlorine	<25 ng/L

**Table 1: Chemical Characteristics of Suitable Water**

Substance	Amount Added to 1 Liter Water	To prepare the reconstituted water, add the following volumes of stock solutions to 1 liter water
Calcium Chloride	11.76 grams	25 mL
Magnesium Sulfate	4.93 grams	25 mL
Sodium Bicarbonate	2.59 grams	25 mL
Potassium Chloride	0.23 grams	25 mL

**Table 2: Examples of Suitable Reconstituted Test Water**

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied. This information is offered solely for your investigation, verification, and consideration.

## Methods

### Test Conditions

- Test Method
  - Test is performed under a static, semi-static, or flow-through condition. If test substance is unstable, a semi-static or flow-through test is recommended.
- Exposure Period
  - 48 hours
- Test Volume
  - At least 2 milliliters
- Number of Test Organisms
  - At least 20 organisms for each test concentration and the control.
- Test Concentration
  - Adopt a concentration range of at least 5 concentrations, with the highest concentration inducing 100% immobilization and no effect at the lowest concentration.
- Culture Method
  - Illumination: The photoperiod is set to 16 hours light and 8 hours dark
  - Temperature: The temperature is between 18°C to 22°C
  - Dissolved Oxygen Concentration: Must be kept at 3mg/L or higher
  - Feeding: Do not feed test organisms

### Observation

- Observe mobility of the organisms at least twice (i.e., at 24 and 48 hours after exposure).
- The organisms are considered immobilized when they do not move for 15 seconds after test vessel is gently shaken.

### Measurement of Test Substance Concentrations

- At the beginning and end of exposure, measure test substance concentrations at the lowest and highest test concentration groups.
  - For volatile or adsorptive substances, additional measurements are recommended at 24 hours intervals during exposure period.

### Test Condition Measurements

- Measure dissolved oxygen in the control and at the highest test concentration at the beginning and end of the exposure period.
- Measure pH in the control and at the highest test concentration at the beginning and end of the exposure period.
- Water temperature should be measured at the beginning and end of the exposure period.

## Data and Reporting

### I. Data

- a. Data should be summarized in tabular form, showing for each treatment group and control, the number of daphnids used, and immobilization at each observation. The percentages immobilized at 24 and 48 hours are plotted against test concentrations. Data are analyzed by appropriate statistical methods (e.g. probit analysis, etc.) to calculate the slopes of the curves and the  $EC_{50}$  with 95% confidence limits ( $p = 0.95$ ).
- b. Where the standard methods of calculating the  $EC_{50}$  are not applicable to the data obtained, the highest concentration causing no immobility and the lowest concentration producing 100% immobility should be used as an approximation for the  $EC_{50}$  (this being considered the geometric mean of these two concentrations).

### II. Test Report

- a. The test report must include the following:
  - i. Test substance:
    1. Physical nature and relevant physical-chemical properties
    2. Chemical identification data, including purity
  - ii. Test species:
    1. Source and species of *Daphnia*, supplier of source (if known), and the culture conditions (including source, kind and amount of food, feeding frequency)
  - iii. Test conditions:
    1. Description of test vessels: type and volume of vessels, volume of solution, number of daphnids per test vessel, number of test vessels (replicates) per concentration
    2. Methods of preparation of stock and test solutions including the use of any solvent or dispersants, concentrations used
    3. Details of dilution water: source and water quality characteristics (pH, hardness, Ca/Mg ratio, Na/K ratio, alkalinity, conductivity, etc); composition of reconstituted water if used
    4. Incubation conditions: temperature, light intensity and periodicity, dissolved oxygen, pH, etc.
  - iv. Results:
    1. The nominal test concentrations and the result of all analyses to determine the concentration of the test substance in the test vessels; the recovery efficiency of the method and the limit of determination should also be reported
    2. All physical-chemical measurements of temperature, pH and dissolved oxygen made during the test
    3. The  $EC_{50}$  at 48 hours for immobilization with confidence intervals and graphs of the fitted model used for calculation, the slopes of the dose-response curves and their standard error; statistical procedures used for determination of  $EC_{50}$

## Results

## OECD 202 Acute Daphnia Assay

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

### Test Results:

Items		Contents
Toxicity Value	48hr EC50	136.0 mg/L
Exposure Concentrations Used for Calculation	Nominal Values	200, 90.1, 43.2, 10.8, 6.9 mg/L
Remarks		Not harmful to aquatic organisms

### Discussion

After 48 hours, the EC50 value for **PhytoCide Aspen Bark Extract Powder** was determined to be 136.0 mg/L. The conditions of OECD guideline 202 for the validity of the test were adhered to: The immobility of controls in purified drinking water (dilution water) did not exceed 10%. According to the EU Directive 93/67/EEC, this product is not classified and therefore not harmful to aquatic organisms.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

OECD 301 B

Ready Biodegradability: CO<sub>2</sub> Evolution (Modified Sturm Test)

### Introduction

A study was conducted to assess the ready biodegradability of **PhytoCide Aspen Bark Extract Powder** in an aerobic aqueous medium. In the OECD guideline 301 for ready biodegradability, six methods are provided as options. This report uses method B, CO<sub>2</sub> Evolution, also known as a Modified Sturm Test. This method was chosen based on the solubility, volatility, and adsorbing capabilities of the test sample.

### Assay Principle

A solution or suspension of the test substance in a mineral medium is inoculated and incubated under aerobic conditions in the dark or in diffuse light. The amount of DOC (Dissolved Organic Carbon) in the test solution due to the inoculum should be kept as low as possible compared to the amount of organic carbon due to the test substance. Allowance is made for the endogenous activity of the inoculum by running parallel blanks with inoculum but without test substance. A reference compound is run in parallel to check the procedures' operation.

In general, degradation is followed by the determination of parameters such as DOC, carbon dioxide production, and oxygen uptake. Measurements are taken at sufficiently frequent intervals to allow the identification of the beginning and end of biodegradation.

Normally this test lasts for 28 days, but it may be ended before that time if the biodegradation curve reaches a plateau for at least three determinations. Tests may also be prolonged beyond 28 days when the curve shows that biodegradation has started but the plateau has not yet been reached. In such cases the test substance would not be classified as readily biodegradable.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

The pass levels for ready biodegradability are 70% removal of DOC and 60% of ThOD (Theoretical Oxygen Demand) or ThCO<sub>2</sub> (Theoretical Carbon Dioxide) production for respirometric methods. They are lower in the respirometric methods since, as some of the carbon from the test chemical is incorporated into new cells, the percentage of CO<sub>2</sub> produced is lower than the percentage of carbon being used. These pass values have to be reached in a 10-day window within the 28-day period of the test. The 10-day window begins when the degree of biodegradation has reached 10% DOC, ThOD, or ThCO<sub>2</sub> and must end before day 28 of the test. Test substances which reach the pass levels after the 28-day period are not deemed to be readily biodegradable.

In order to check the procedure, reference compounds which meet the criteria for ready biodegradability are tested by setting up an appropriate vessel in parallel as part of normal test runs. Suitable compounds are freshly distilled aniline, sodium acetate, and sodium benzoate. These compounds all degrade in this method even when no inoculum is deliberately added.

Because of the nature of biodegradation and of the mixed bacterial populations used as inocula, determinations should be carried out at least in duplicate. It is usually found that the larger the concentration of microorganisms initially added to the test medium, the smaller the variation between replicates.

## Materials

- Water
  - Deionized or distilled, free from inhibitory concentrations of toxic substances
  - Must contain no more than 10% of the organic carbon content introduced by the test material
  - Use only one batch of water for each series of tests
- Mineral media
  - To prepare the mineral medium, mix 10 mL of solution A with 800 mL water. Then add 1 mL each of solutions B, C, and D and make up to 1 liter with water.
  - Solution A (Dissolve in water and make up to 1 liter; pH 7.4)
    - Potassium dihydrogen orthophosphate, KH<sub>2</sub>PO<sub>4</sub>.....8.5g
    - Dipotassium hydrogen orthophosphate, K<sub>2</sub>HPO<sub>4</sub>.....21.8g
    - Disodium hydrogen orthophosphate dehydrate, Na<sub>2</sub>HPO<sub>4</sub>·2H<sub>2</sub>O.....33.4g
    - Ammonium chloride, NH<sub>4</sub>Cl.....0.5g
  - Solution B (Dissolve in water and make up to 1 liter)
    - Calcium chloride, anhydrous, CaCl<sub>2</sub>.....27.50g
    - Or
    - Calcium chloride dehydrate, CaCl<sub>2</sub>·2H<sub>2</sub>O.....36.40g
  - Solution C (Dissolve in water and make up to 1 liter)
    - Magnesium sulphate heptahydrate, MgSO<sub>4</sub>·7H<sub>2</sub>O..... 22.50g
  - Solution D (Dissolve in water and make up to 1 liter.)
    - Iron (III) chloride hexahydrate, FeCl<sub>3</sub>·6H<sub>2</sub>O.....0.25g
  - Flasks, 2-5 liters each, fitted with aeration tubes reaching nearly to the bottoms of the vessels and an outlet
  - Magnetic stirrers
  - Gas absorption bottles
  - Device for controlling and measuring air flow
  - Apparatus for carbon dioxide scrubbing, for preparation of air which is free from carbon dioxide; alternatively, a mixture of CO<sub>2</sub>-free oxygen and CO<sub>2</sub>-free nitrogen from gas cylinders in the correct proportions (20% O<sub>2</sub> : 80% N<sub>2</sub>)
  - Device for determination of carbon dioxide, either titrimetrically or by some form of inorganic carbon analyzer

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
 This information is offered solely for your investigation, verification, and consideration.

- Stock solutions of test substances
  - When solubility of the substance exceeds 1 g/L, dissolve 1-10 g, as appropriate, of test or reference substance in water and make up to 1 liter. Otherwise, prepare stock solutions in mineral medium or add the chemical directly to the mineral medium, making sure it
- Inoculum
  - The inoculum may be derived from the following sources
    - Activated sludge
    - Sewage effluents
    - Surface waters
    - Soils
    - Or from a mixture of these.
  - Inoculum may be pre-conditioned to the experimental conditions, but not pre-adapted to the test substance. Pre-conditioning consists of aerating activated sludge in mineral medium or secondary effluent for 5-7 days at the test temperature. Pre-conditioning sometimes improves the precision of the test method by reducing blank values.

## Methods

- I. Preparation of flasks: As an example, the following volumes and weights indicate the values for 5-liter flasks containing 3 liters of suspension. If smaller volumes are used, modify the values accordingly.
  - a. To each 5-liter flask, add 2,400 mL mineral medium.
  - b. Add an appropriate volume of the prepared activated sludge to give a concentration of suspended solids of not more than 30 mg/L in the final 3 liters of inoculated mixture. Alternatively, first dilute the prepared sludge to give a suspension of 500-1000 mg/L in the mineral medium before adding an aliquot to the contents of the 5-liter flask to attain a concentration of 30 mg/L.
  - c. Aerate these inoculated mixtures with CO<sub>2</sub>-free air overnight to purge the system of carbon dioxide.
  - d. Add the test material and reference compound, separately, as known volumes of stock solutions, to replicate flasks to yield concentrations, contributed by the added chemicals, of 10 – 20 mg DOC or TOC per liter. Leave some flasks without addition of chemicals as inoculum controls. Add poorly soluble test substances directly to the flasks on a weight or volume basis. Make up the volumes of suspensions in all flasks to 3 liters by the addition of mineral medium previously aerated with CO<sub>2</sub>-free air.
  - e. If required, use one flask to check the possible inhibitory effect of the test substance by adding both the test and reference substances at the same concentrations as present in the other flasks.
  - f. If required, check whether the test substance is degraded abiotically by using a sterilized uninoculated solution of the chemical. Sterilize by the addition of a toxic substance at an appropriate concentration.
  - g. If barium hydroxide is used, connect three absorption bottles, each containing 100 mL of 0.0125M barium hydroxide solution, in series to each 5-liter flask. The solution must be free of precipitated sulfate and carbonate and its strength must be determined immediately before use.
  - h. If sodium hydroxide is used, connect two traps, the second acting as a control to demonstrate that all the carbon dioxide was absorbed in the first. Absorption bottles fitted with serum bottle closures are suitable. Add 200 mL 0.05M sodium hydroxide to each bottle. This is sufficient to absorb the total quantity of carbon dioxide evolved when the test substance is completely degraded.
  - i. In a typical run, the following flasks are used:
    - i. Flasks 1 & 2: containing test substance and inoculum (test suspension)
    - ii. Flasks 3 & 4: containing only inoculum (inoculum blank)
    - iii. Flask 5: containing reference compound and inoculum (procedure control)
    - iv. Flask 6: containing test substance and sterilizing agent (abiotic sterile control)
    - v. Flask 7: containing test substance, reference compound and inoculum (toxicity control)

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

- II. Start the test by bubbling CO<sub>2</sub>-free air through the suspensions at a rate of 30-100 mL/minute.
- III. CO<sub>2</sub> Determination
- It is mandatory to follow the CO<sub>2</sub> evolution from the test suspensions and inoculum blanks in parallel and it is advisable to do the same for the other test vessels.
  - During the first ten days it is recommended that analyses of CO<sub>2</sub> should be made every second or third day and then at least every fifth day until the 28<sup>th</sup> day so that the 10-day window period can be identified. On the days of CO<sub>2</sub> measurement, disconnect the barium hydroxide absorber closest to the test vessel and titrate the hydroxide solution with 0.05M HCl using phenolphthalein as the indicator. Move the remaining absorbers one place closer to the test vessel and place a new absorber containing 100 mL fresh 0.0125M barium hydroxide at the far end of the series. Make titrations are needed (for example, when substantial precipitation is seen in the first trap and before any is evident in the second, or at least weekly). Alternatively, with NaOH as absorbent, withdraw a sample of the sodium hydroxide solution from the absorber nearest to the test vessel using a syringe. The sample volume needed will depend on the carbon analyzer used, but sampling should not significantly change the absorbent volume over the test period. Inject the sample into the IC part of the carbon analyzer for analysis of evolved carbon dioxide directly. Analyze the contents of the second trap only at the end of the test in order to correct for any carry-over of carbon dioxide.
  - On the 28<sup>th</sup> day withdraw samples, optionally, for DOC and/or specific chemical analysis. Add 1 mL of concentrated hydrochloric acid to each test vessel and aerate them overnight to drive off the carbon dioxide present in the test suspensions. On day 29 make the last analysis of evolved carbon dioxide.

## Data and Reporting

- I. Treatment of Results
- Data from the test should be entered onto the attached data sheet.
  - The amount of CO<sub>2</sub> produced is calculated from the amount of base remaining in the absorption bottle. When 0.0125M Ba(OH)<sub>2</sub> is used as the absorbent, the amount remaining is assessed by titrating with 0.05M HCl.
  - Since 1 mmol of CO<sub>2</sub> is produced for every mol of Ba(OH)<sub>2</sub> reacted to BaCl<sub>2</sub> and 2 mmol of HCl are needed for the titration of the remaining Ba(OH)<sub>2</sub> and given that the molecular weight of CO<sub>2</sub> is 44 g, the weight of CO<sub>2</sub> produced (in mg) is calculated by:

$$\frac{0.05 \times (50 - mL\ HCl\ Titrated) \times 44}{2} = 1.1 \times (50 - mL\ HCl\ Titrated)$$

Therefore, the factor to convert volume of HCl titrated to mg CO<sub>2</sub> produced is 1.1 in this case. Calculate the weights of CO<sub>2</sub> produced from the inoculum alone and from the inoculum plus test substance using the respective titration values. The difference is the weight of CO<sub>2</sub> produced from the test substance alone.

- d. The percentage biodegradation is calculated from:

$$\% \text{ Degradation} = \frac{\text{mg CO}_2 \text{ Produced}}{\text{ThCO}_2 \times \text{mg Test Substance Added}} \times 100$$

Or

$$\% \text{ Degradation} = \frac{\text{mg CO}_2 \text{ Produced}}{\text{mg TOC Added in Test} \times 3.67} \times 100$$

Where 3.67 is the conversion factor  $\left(\frac{44}{12}\right)$  for carbon to carbon dioxide

- e. When NaOH is used as the absorbent, calculate the amount of CO<sub>2</sub> produced after any time interval from the concentration of inorganic carbon and the volume of absorbent used. Calculate the percentage degradation from:

$$\% \text{ ThCO}_2 = \frac{\text{mg IC from Test Flask} - \text{mg IC from Blank}}{\text{mg TOC Added as Test Substances}} \times 100$$

- f. Display the course of degradation graphically and indicate the 10-day window. Calculate and report the percentage removal achieved at the plateau, at the end of the test, and/or at the end of the 10-day window, whichever is appropriate.
- g. When appropriate, calculate DOC removals using the equation given in 301 A paragraph 27.
- h. When an abiotic control is used, calculate the percentage abiotic degradation by:

$$\% \text{ Abiotic Degradation} = \frac{\text{CO}_2 \text{ Produced by Sterile Flask After 28 Days (mg)}}{\text{ThCO}_2 \text{ (mg)}} \times 100$$

### Validity of Tests

- i. The IC content of the test substance suspension in the mineral medium at the beginning of the test must be less than 5% of the TC, and the total CO<sub>2</sub> evolution in the inoculum blank at the end of the test should not normally exceed 40 mg/L medium. If values greater than 70 mg CO<sub>2</sub>/L are obtained, the data and experimental technique should be examined critically.

## Discussion

Based on the testing conducted in accordance with the specified method, test **PhytoCide Aspen Bark Extract Powder** achieved 93.4% biodegradation after 28 days of testing. The product met method requirements for Readily Biodegradability classification.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied. This information is offered solely for your investigation, verification, and consideration.

## SECTION 2. HAZARD(S) IDENTIFICATION

### Classification:

#### GHS / CLP

**Basis for Classification:** Based on present data no classification and labeling is required according to GHS, taking into account the national implementation (United Nations version 2011)

#### USA

**OSHA Regulatory Status:** This material is non-hazardous as defined by the American OSHA Hazard Communication Standard (29 CFR 1910.1200).

#### Europe

**Basis for Classification:**

- According to present data no classification and labeling is required according to Directives 67/548/EEC or 1999/45/EC.
- This product is not classified as hazardous to health or environment according to the CLP regulation.

### Labeling Elements:

**Pictograph:** No hazard symbol expected

**Hazard statements/Signal Word:** H320: WARNING: Causes minimal eye irritation

**Precautionary statements:**

- P233: Keep container tightly closed
- P281: Use personal protective equipment as required
- P402: Store in a dry place
- P404: Store in a closed container
- P410: Protect from sunlight
- P411: Store at temperatures not exceeding 25°C

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

-vPvB: Not applicable

## SECTION 3. COMPOSITION / INFORMATION ON INGREDIENTS

**Common Chemical Name:** Populus Tremuloides Bark Extract

**Generic name:**

**Chemical Family:** Plant Extract

**Description:** Substance

<u>Substance</u>	<u>CAS Numbers</u>	<u>EC Numbers</u>	<u>Percentage</u>
Populus Tremuloides Bark Extract	90083-05-9	290-199-2	100.00%

**Formula:** Not applicable

## SECTION 4. FIRST-AID MEASURES

**General:** In all cases of doubt, or when symptoms persist, seek medical attention.

**Inhalation:** Move to fresh air from exposure area. Get medical attention for any breathing difficulty.

**Skin contact:** Rinse with soap and water. Get medical advice if irritation develops.

**Eye contact:** Immediately rinse with water for at least 15 minutes, while keeping the eyes wide open. Consult with a physician.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

Replaces version: 7

---

---

**Ingestion:** Consult with a physician.  
**Protection of first-aiders:** No special protection required.

---

---

## SECTION 5. FIRE-FIGHTING MEASURES

**Fire and explosion hazards:** Not considered to be a fire and explosion hazard

**Extinguishing media:**

Suitable: Water, dry chemicals, foam & carbon dioxide.

Not suitable: None known

**Fire fighting:** Move container from fire area if it can be done without risk.  
Avoid inhalation of material or combustion by-products.  
Stay upwind and keep out of low area

**Protection for fire-fighters:** Boots, gloves, goggles.

---

---

## SECTION 6. ACCIDENTAL RELEASE MEASURES

**Personal precautions:** Avoid contact with eyes.

Personal Protective Equipment:  
-Protective goggles

**Environmental precautions:** Prevent entry into sewers and waterways. Do not allow material to contaminate ground water system

**Methods for cleaning up:**

Recovery: Pick up free liquid for recycling or disposal. Residual liquid can be absorbed on an inert material.

Cleaning/Decontamination: Wash non-recoverable remainder with water.

Disposal: For disposal of residues refer to sections 8 & 13.

---

---

## SECTION 7. HANDLING AND STORAGE

**Handling**

Technical measures: Labeling: Keep out of the reach of children.

Measures: For industrial use, only as directed.

Safe handling advice: Wash hands after use. Avoid storage near feed or food stuff.

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## Storage

Technical measures: Keep container closed.  
Recommended Storage Conditions: Store in a cool, dry place. This product should be stored at room temperature (23 - 25°C). It should not be exposed to excessive heat or cold. Do not freeze.

Incompatible products: Avoid contact with strong oxidizers.  
Refer to the detailed list of incompatible materials (Section 10 Stability/Reactivity)

Packaging: Product may be packaged in normal commercial packaging.  
Packaging materials: Recommended - Polypropylene & High Density Polyethylene

## SECTION 8. EXPOSURE CONTROLS / PERSONAL PROTECTION

**Precautionary statements:** Ensure adequate ventilation

### Control parameters

Occupational exposure Limits:

France: Not Determined  
ACGIH: Not Determined  
Korea: Not Determined  
UK: Not Determined

Surveillance procedures: Not Determined  
Engineering measures: Not Determined

### Personal Protective Equipment:

Respiratory protection: Local exhaust  
Hand protection: Protective gloves made of rubber or neoprene.  
Eye protection: Safety glasses.  
Collective emergency equipment: Eye fountain.  
Skin and Body Protection: Suitable protective clothing

Hygiene measures: Handle in accordance with good industrial hygiene and safety practice.  
Measures related to the Environment: No particular measures.

## SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

**Appearance:** Free flowing powder - Hygroscopic

**Color:** White to light yellow

**Odor:** Characteristic

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## SECTION 13. DISPOSAL CONSIDERATIONS

### Residues from product

Prohibition: Do not allow the product to be released into the Environment.  
Destruction/Disposal: Dispose of in accordance with relevant local regulations

### Contaminated packaging

Decontamination/cleaning: Cleaning is not required prior to disposal.  
Destruction/Disposal:

Note: Take all necessary precautions when disposing of this product according to local regulations.

## SECTION 14. TRANSPORT INFORMATION

**UN Number:** None  
**UN Shipping Name:** None

**Transport Hazard Class:** Not classified as dangerous for transport

Land (rail/road): Material is not restrictive for land transport and is not regulated by ADR/RID  
Sea: Material is not restrictive for sea transport and is not regulated by IMO/IMDG  
Air: Material is not restrictive for land transport and is not regulated by ICA/IATA

**Marine Pollutant:** No

**Transport/Additional Information:** Not regulated for US DOT Transport in non-bulk containers  
This material is not dangerous or hazardous

**Special Precautions for User:** None known

The above regulatory prescriptions are those valid on the date of publication of this sheet. However, given the possible evolution of transport regulations for hazardous materials and in the event of the MSDS in your possession dating back more than 12 months, it is advisable to check their validity with your sales office.

## SECTION 15. REGULATORY INFORMATION

### Labeling/Restrictions:

EC regulations: Not to be used for children under three years of age  
Chinese regulations: Not to be used for children under three years of age  
Brazilian regulations: Not to be used for children under three years of age  
ASEAN regulations: Not to be used for children under three years of age  
Mexico regulations: Not to be used for children under three years of age

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## PhytoCide Aspen Bark Extract Powder Code: M16002

Attention must be paid to the use of PhytoCide Aspen Bark Extract Powder in the equivalent of OTC formulations (eg. quasi-drugs in Japan, or therapeutic goods in Australia). Some countries maintain restricted inventories of raw materials that can be used in those applications so more detailed guidance may be required.

PhytoCide Aspen Bark Extract Powder and any components or impurities are in compliance with the rules governing cosmetic products in the European Union (Directive 76/768/ECC & Regulation No. 1223/2009). However, PhytoCide Aspen Bark Extract Powder contains natural phenolics which will test positive for salicylic acid (see also Specification). This should be borne in mind when formulating products containing PhytoCide Aspen Bark Extract Powder. The recommended use levels for PhytoCide Aspen Bark Extract Powder is 0.20 – 3.00%.

PhytoCide Aspen Bark Extract Powder is in compliance with the standardized set of rules developed and approved by the NPA (Natural Products Association).

PhytoCide Aspen Bark Extract Powder is considered a non-hazardous material. All significant toxicological routes of absorption have been considered as well as the systemic effects and margin of safety (MoS) based on a no observed adverse effects level (NOAEL). Due to the restriction placed on animal testing of cosmetic raw materials, and Active Micro Technologies, LLC's internal non-animal testing policy, this product was not tested for NOAEL.

PhytoCide Aspen Bark Extract Powder was tested using *in vitro* dermal and ocular irritation models. This product was found to be non-irritating in both models.

To our knowledge the above material is free of CMR (\*) substances, as defined according to Regulation (EC) No 1272/2008 and Cosmetic Regulation (EC) No 1223/2009 as amended.

(\*) Carcinogenic, Mutagenic, toxic for Reproduction

Active Micro Technologies, LLC certifies that to the best of our knowledge our product does not contain any material listed on California Proposition 65.

Active Micro Technologies, LLC certifies that PhytoCide Aspen Bark Extract Powder does not contain any materials prohibited by Halal laws.

Active Micro Technologies, LLC certifies that this material has not been manufactured using any of the species listed in the CITES Appendices as of November 20, 2015.

PhytoCide Aspen Bark Extract Powder is REACH Compliant and free of the following:

- BHA & BHT
- Diethylene glycol (DEG)
- Formaldehyde or formaldehyde donors
- Glycol ethers
- Gluten
- Irradiation
- Lactose
- Nanoparticles
- Nitrosamines
- Palm oil/palm kernel oil (or derivatives)
- Parabens
- Paraffin/petroleum products
- Phthalates
- Polyethylene glycol (PEG)
- Residual solvents
- Sulfates
- Volatile organic compounds

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## Raw Component Regulations

Please note that the below are global regulations for the raw materials used to manufacture PhytoCide Aspen Bark Extract Powder and are not for the product itself.

PhytoCide Aspen Bark Extract Powder contains 54.0 – 60.0% Phenolics (tested as Salicylic Acid). See below for a list of regulations:

### Salicylic Acid and salts:

- **Europe: Maximum Authorized Concentration up to 3.00% (0.50% as acid) when used other than a preservative, depending on the application:**
  - a) Rinse-off products: Up to 3.00%
  - b) Other products: Up to 2.00%
  - \*Limitations and requirements: Not to be used in preparations for children under 3, except for shampoos
  - \*Conditions of use and warnings which must be printed on the label: Not to be used for children under three years of age (1)
  - \*Note (1): Solely for products which might be used for children under three years of age and which remain in prolonged contact with the skin
  - \*Intended Purpose must be apparent from the presentation of the final product (e.g. facial toner, anti-acne lotion, peeling gel, etc.)
- **USA: Salicylic Acid is safe when formulated to avoid irritation and to avoid increasing sun sensitivity, or when increased sun sensitivity would be expected, directions for use include the daily use of sun protection.** (Journal Citation: IJT 22(3):1-108)
- **Japan: Maximum Authorized Concentration:**
  - \*Salicylic Acid: 0.20 (per 100 grams)
  - \*Salicylic Acid Salts: 1.00 as total (per 100 grams)
- **Canada: Salicylic Acid permitted in concentrations of 2.00% or less**
- **China: Maximum Authorized Concentration of 0.50% (as acid)**
  - \*Limitations and requirements: Not to be used in products for children under age 3, except for shampoo
  - \*Warnings: Do not use for children under 3
- **Brazil: Maximum authorized concentration 0.50% (as acid):**
  - \*Limitations: Not to be used in children's products under 3 years, except for shampoos
  - \*Warnings: Not to be used for children under 3 years of age (1)
  - \*Note (1): Solely for products which might be used for children under three years of age and which remain in prolonged contact with the skin
- **Mexico: Maximum authorized concentration 0.50% (as acid):**
  - \*Limitations: Not to be used in preparations for children under 3 years of age
- **ASEAN: Maximum authorized concentration 0.50% (as acid):**
  - \*Limitations: Not to be used in preparations for children under 3 years of age, except for shampoos
  - \*Warnings: Not to be used for children under 3 years of age
- **Mercosur: Maximum authorized concentration 0.50% (as acid):**
  - \*Limitations: Not to be used in preparations for children under 3 years of age, except for shampoos
  - \*Warnings: Not to be used for children under 3 years of age

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## Free Protein Residue Statement

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

---

April 16, 2015

To whom it may concern,

This letter is to certify that PhytoCide Aspen Bark Extract Powder (M16002) contains less than 50 ppm free protein residue.

Thank you for your interest in Active Micro Technologies' products. If you have any further questions, feel free to contact us at (704) 276-7100.

Best Regards,

Tomorrow's Vision... Today!®

Heather Ferguson | [R&D Coordinator](#)

## CEPA Statement

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

---

### PhytoCide Aspen Bark Extract Powder Code: M16002

According to the **Canadian Environmental Protection Act, 1999**, any products listed under the **Domestic Substance List** are considered acceptable in Canada for Cosmetic use.

According to Part I 6(a), if a product is not listed on the **Domestic Substance List** and the import amount exceeds 20kg but does not exceed 1000kg per calendar year, **Schedule 1** states that the trade name and the material safety data sheet is acceptable documentation for determining the product's safety and toxicity for use in Canada.

These consist of the following materials:

-*Populus tremuloides* Bark Extract (CAS 90083-05-9): *listed on MSDS*

## Rare Earth Elements

107 Technology Drive • Lincolnton, NC 28092  
(704) 276-7100 • Fax (704) 276-7101

---

### PhytoCide Aspen Bark Extract Powder Code: M16002

Active Micro Technologies, LLC certifies that we have not analyzed the above listed ingredient for rare earth elements listed in the Chinese FDA PRC regulatory documents. However, based on the origin of the raw materials and the manufacturing processes utilized in this production, we do not expect any of the below listed rare earth elements to be present in PhytoCide Aspen Bark Extract Powder. These elements include:

<u>Element</u>	<u>Symbol</u>
Cerium	Ce
Dysprosium	Dy
Erbium	Er
Europium	Eu
Gadolinium	Gd
Holmium	Ho
Lanthanum	La
Lutetium	Lu
Neodymium	Nd
Praseodymium	Pr
Samarium	Sm
Terbium	Tb
Thulium	Tm
Yttrium	Y
Ytterbium	Yb

This information is presented in good faith but is not warranted as to accuracy of results. Also, freedom from patent infringement is not implied.  
This information is offered solely for your investigation, verification, and consideration.

## Nanomaterials Certificate

107 Technology Drive • Lincolnton, NC 28092

---

### PhytoCide Aspen Bark Extract Powder Code: M16002

We, **Active Micro Technologies, LLC**, hereby certify that the product **PhytoCide Aspen Bark Extract Powder** does not contain nanomaterials as defined by:

- **French Decree N°2012-232**: “Substances as defined in Article 3 of Regulation (EC) No 1907/2006, made intentionally at nanoscale containing free particles, or contained in an aggregate or agglomerate with a minimum proportion of the particles in the distribution size in number, have one or more outer dimensions between 1 nm and 100 nm. By law of 6 August 2012, the minimum proportion of the nanoparticles in the distribution size in number is set up at 50%.”
- **Regulation N° 1223/2009**: “insoluble or biopersistent and intentionally manufactured material with one or more external dimensions, or an internal structure, on the scale from 1 to 100 nm.”

**Location:** Lincolnton, NC 28092 (USA)
